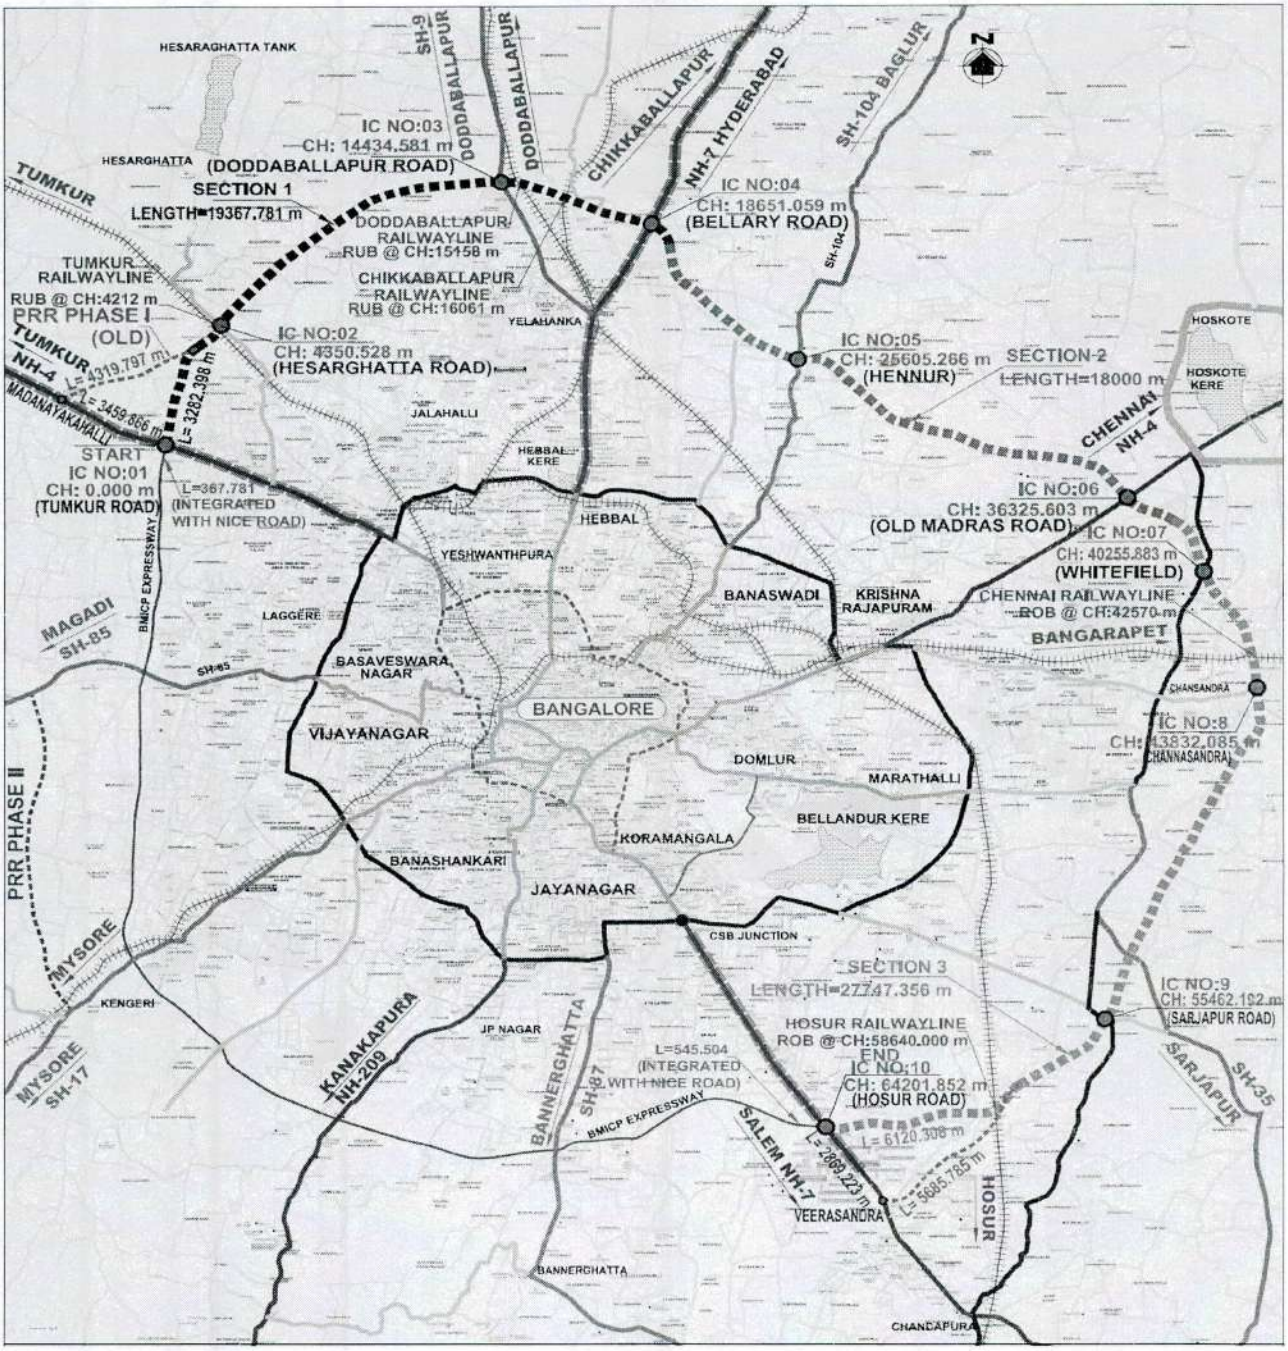
CONSTRUCTION OF EIGHT LANE PERIPHERAL RING ROAD TO BANGALORE CITY



DRAFT DETAILED PROJECT REPORT

February 2020

GOVERNMENT OF KARNATAKA

Bangalore Development Authority
T. Chowdaiah Road, Kumara Park West,
Bengaluru- 560020.

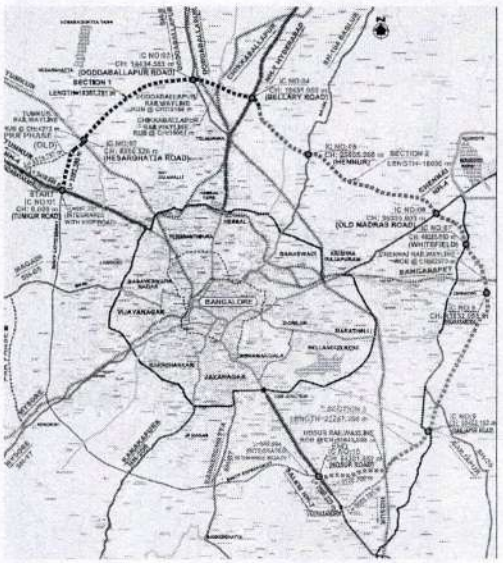
TABLE OF CONTENTS

LIST OF TABLE

LIST OF FIGURES

Executive Summary

Bangalore is the fifth largest city in India with an estimated population of more than 100 Lakhs spread over 821 Sq Km. The present day vehicle population is ~75 Lakh. The city has seen an increase of over 10.2% in last 10 years while the population is has increased by ~ 3.25% during the same period.



Bangalore has a radial road network with 6 primary National Highways and 6 State Highways converging / diverging from existing Outer Ring Road. The outer most road for Bangalore city at present is 65 Km long Outer Ring Road (ORR) constructed by Bangalore Development Authority. ORR was constructed as bypass to city taking away commercial vehicles and long distance personalised vehicles. Due to rapid ribbon development along ORR and beyond ORR lead to increase traffic on ORR and its interconnected roads. This has lead to traffic congestion at all major intersections and at midblock sections. Shift in International Airport from HAL to Devanahalli has changed the travel pattern in the city. At present, agencies like BDA and BBMP are implementing grade separators along ORR and at important junctions in the city. But this has not relieved traffic congestion between junctions.

The proposed Peripheral Ring Road (PRR) is planned beyond ORR at a distance of 17Km to 25Km from city centre. The proposed road is planned for following purposes:

- To take away commercial vehicles and long distance passenger cars from the city.
- Reduce traffic congestion on all existing radial roads leading to existing Outer Ring Road.
- Reduce traffic congestion on existing Outer Ring Road
- Create a new road network beyond ORR considering future needs for the city.

PRR is proposed with 100m Right of Way based on direction from the Government. The cross section comprises of divided eight lane main road separated with central median of 13m. Service roads, 11m in width in each direction are provided on either side of main road for local traffic. Main road is access controlled for trucks, buses, LCV and passenger cars. Service road and Main road are separated by built up drain. The space beyond service road

is proposed with Footpath (2m), cycle track (2m), space for U/G cable and other utilities (3m) and an exclusive green corridor of 5m throughout the ROW.

There are 10 locations where PRR crosses major radial roads (National Highways and State highways). Junction treatment in the form of grade separator / interchanges is proposed at all junctions. PRR also crosses existing railway lines at 5 locations, where ROB / RUB are proposed.

Entry and exit to PRR is regulated. Traffic can enter and exit main road at major intersections after paying toll. Even though, the project is proposed to be taken up on Engineering Procurement & Construction basis or Hybrid Annuity Model, BDA may desire at a later date to levy toll from road users. Hence, toll plaza are proposed at entry and exit of all major intersections.

The project road is proposed with other facilities like cross drainage structures, longitudinal drains, median drains, and additional culverts across PRR for water supply lines, utility ducts and chambers. Road furniture like road signs, lane markings, crash barriers, road delineators, raised pavement markers, landscaping / arboriculture.

The project also aims to implementation of comprehensive state of the art Intelligent Transport System for the project road.

Land Acquisition required for construction of PRR project is in the progress.

The revised Detailed Project Report takes into consideration the fresh topography survey, revised cross section elements, suggestions / directions from Technical Advisory Committee / BDA / GOK, change in schedule of rates and approximate estimated project civil construction cost is Rs 4869 Crores. The project is expected to be completed in 36 months.

-----XXXXX-----

SECTION – 1

INTRODUCTION

1 INTRODUCTION

1.1 General

Bangalore is the fifth largest city in India with an estimated population of over 115 Lakhs (2011). The city limit which was around 425 Sq Km in 2007 has increased to over 800 Sq Km in a span of 6 years. However, the city road networks have not seen major improvements either in terms of enhancement of existing roadway capacity or creation of new road networks to reduce traffic congestion. The present day vehicle population in the city is around 85 Lakh with an average increase of vehicles at the rate of 10% per annum.

1.2 Existing Scenario

Bangalore has a radial road network around the city converging at existing outer ring road. There are 5 Primary road networks – NH-4 towards Pune on West, NH-7 towards Hyderabad on North, NH-4 towards Chennai on East, NH-7 towards Salem on South, NH-209 towards Dindigual towards South-West and NH-275 on South East. In addition there are 5 radial Secondary roads – SH-9 towards Doddaballapur on North-West, SH-85 towards Magadi on West, SH-87 towards Bannerghatta towards South and SH-104 towards Hennur. Key Plan of existing road network is given in Figure 1-1.

The existing road network within city includes core ring road of ~ 29 Km which covers Central Business Area of the city. The existing outer most road for the city is Outer Ring Road, 65 Km in length which was constructed by Bangalore Development Authority. Outer Ring Road has four lane configuration generally with service roads on both sides of main road for most of the length except ~ 10 Km. The right of way for ORR is 45m or less at some sections, which has been encroached by road side developments and hence, there is no scope for horizontal widening.

The existing outer most road for Bangalore City is 65 Km long Outer Ring Road. Outer Ring Road project was implemented with the intention of diverting long distance traffic, especially truck traffic away from the city roads. However, over a period of time, outer ring road has become a part of city road with development of residential and commercial establishments on both sides of the road. This has lead to increase in traffic along ORR. Based on the available statistics, the volume to capacity ratio at midblock section (away from junctions) is between 1.5 and 2 whereas the desirable ratio shall not more than 0.72 as per Indian Road Congress standard (IRC:106) for an urban road.

National Highway Authority of India (NHAI) has implemented elevated roads on Hosur Road (NH7) from Bommanahalli (close to Silk Board Junction on ORR) and Tumkur road (NH4)

from Guraguntepalya junction on ORR and on Bellary road just after Hebbal junction upto Airport entry on NH-7. The elevated roads will increase the roadway capacity on existing road sections by taking away through traffic on elevated road and relieve traffic congestion beyond ORR. However, the traffic on elevated road should still pass through existing ORR and its interconnected road within the city limits which is already crowded. Hence, traffic dispersal at ORR and within the city roads are not eased.

Hence, it has become necessary to develop an alternative road facility away from ORR which will take away commercial and personalized vehicles entering city centre and at the same time relieve city roads of traffic congestion. Ideally, Bangalore city should have a circular ring road beyond existing ORR with connection to ORR and city through radial roads (primary and secondary roads). This will reduce traffic congestion on all radial roads, ORR and city roads.

Nandi Infrastructure Corridor Enterprises Limited (NICE) has implemented 45Km long 4 lane divided road between Hosur road (NH7) on south and Tumkur road (NH4) on west. This is a toll road for all traffic (passenger vehicles, commercial vehicles and T/w) using the stretch. At present commercial vehicles between Tumkur road and Hosur road which are not allowed on ORR are using the NICE road. The Right of Way for development of NICE road is 75m. Service roads are not provided on either side of main road.

The proposed PRR takes off on Tumkur road and terminates at Hosur road totaling 65 Kms. Bangalore city has radial road connected to ORR, it is necessary to develop an alternative concentric road around the city beyond ORR. Hence, it is advantageous to make use of existing access controlled NICE road and connected with proposed Peripheral Ring Road so that the final road network will be a "full circle" to Bangalore city.

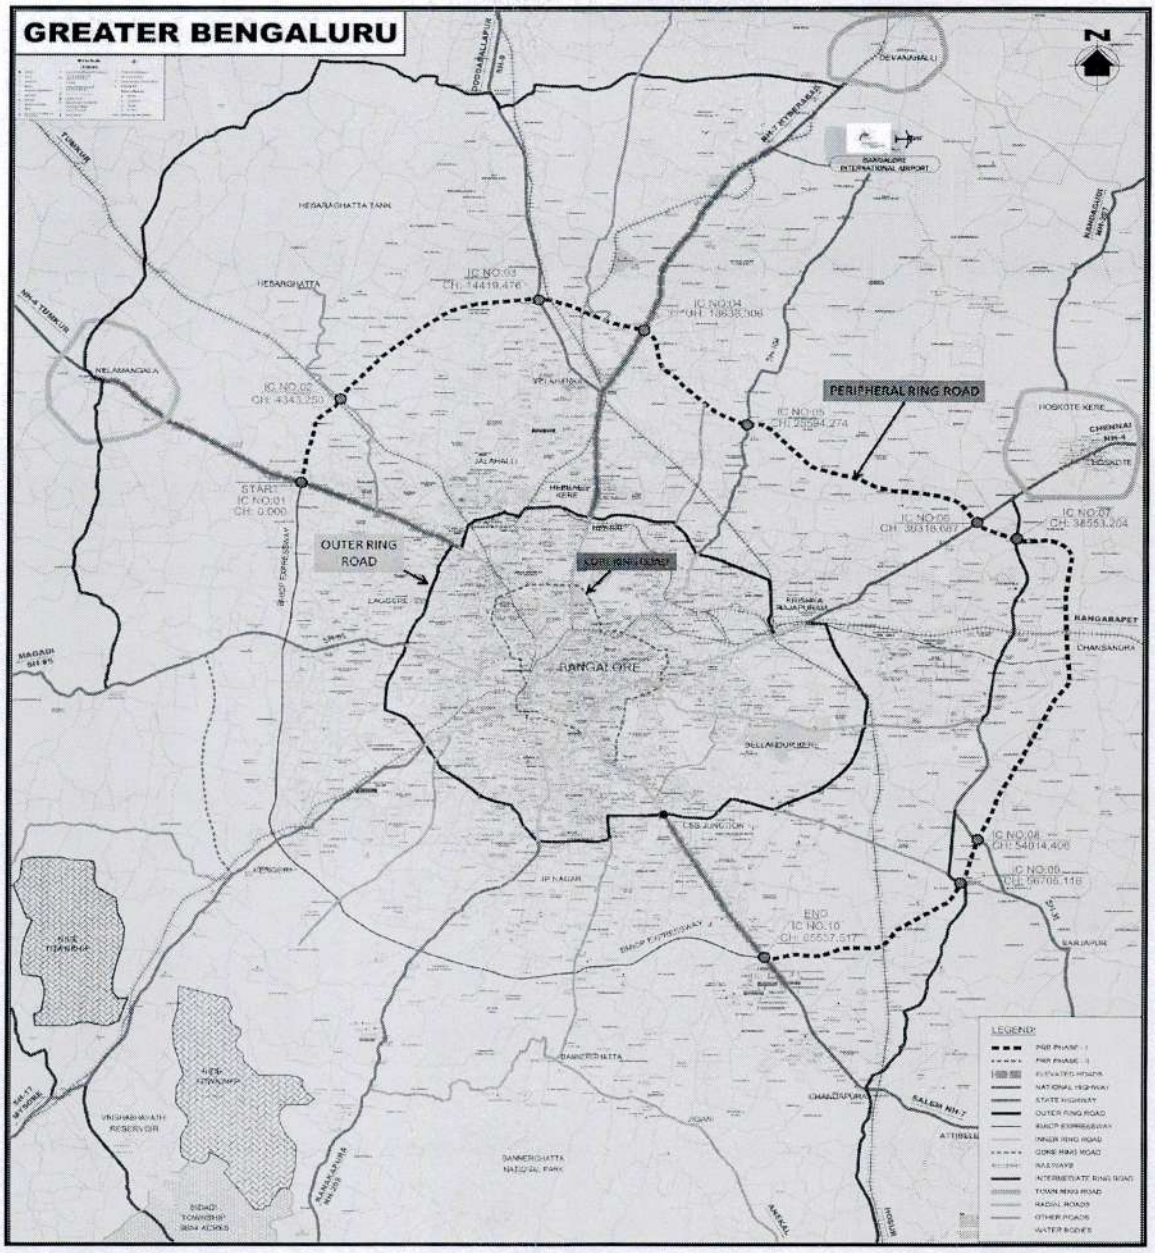


Figure 1-1: Key Plan of Existing Major Road Networks

Bengaluru Development Authority (BDA) henceforth referred to as "Owner" is desirous in implementing 65km long Peripheral Ring Road between Tumkur Road and Hosur Road via Bellary Road and Old Madras Road. The proposed alignment of PRR will be located at a radial distance of 17 km - 25 km from city centre and acts as a bypass to the city for the long distance personalised vehicles (cars and cabs) and commercial vehicles (trucks and LCVs). The Key Plan of PRR alignment is given in Figure 1-2.

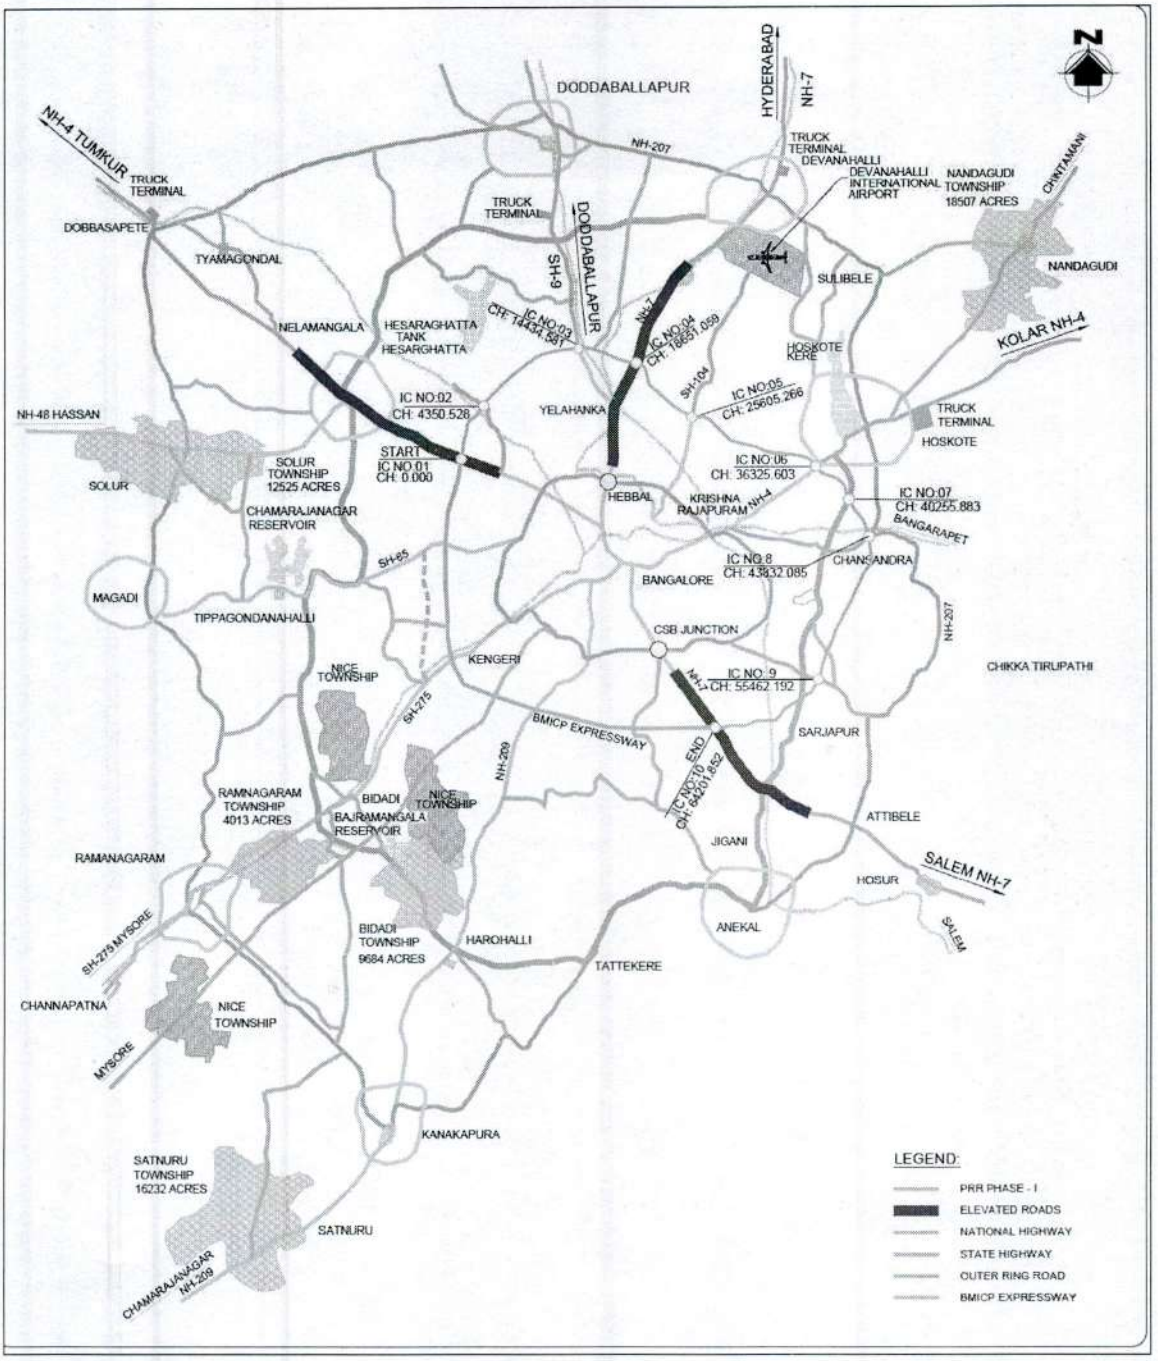

Figure 1-2: Key Plan of PRR with existing Elevated Roads

1.3 Objectives

The proposed "Peripheral Ring Road" is 65 km long and connects 10 major Highways namely Tumkur Road(NH-4), Hesaraghatta Road(SH-39), Doddaballapura Road(SH-09), Bellary Road (NH-7), Hennur- Baglur Road (SH-104), OMR (NH-4), Whitefield road, Channasandra Main Road, Hoskote-Anekal Road(SH-35), Sarjapur Road and Hosur Road(NH-7). Overall, it intersects 4 National Highways and 6 state Highways. The

proposed PRR length from start point on Tumkur road upto end point on Hosur road is 64.201 Km. Since, the alignment is getting integrated with NICE road on Tumkur road (~ 368m) and Hosur road (~ 546m), the total length of the project road is considered to be 65.115 Km.

The prime objectives of the proposed corridor are:

- To relieve congestion on the metropolitan area and the outer ring road.
- To provide linkage to the radial roads & Arterial roads.
- To connect the new urban nodes outside the city.
- To provide quick access to the international airport from strategic parts of the city

1.4 Revisions from earlier submissions

The consultant had submitted Draft DPR RN-05 Rev R(1) for the project in May 2013. The document was reviewed by Technical Team of JICA, BDA and DULT in addition to making project presentation to Technical Advisory Committee of BDA. Various aspects of the project discussed and conclusions drawn are summarized below:

- Revision in typical cross section to accommodate an exclusive 12m wide central median and paved shoulder of 1.5m with consequent changes in main road, service road and utility corridor.
- Minor revisions in traffic assignment based on joint review with JICA technical team
- Change of pavement type from flexible to rigid for main road.
- Revision in Bill of Quantities for change in project cross section
- Revision in Cost Estimate considering PWD SR 2013-14

Based on the revised inputs and details, the consultant had revised the DPR and submitted Final DPR as RN-05 Rev R(2) in August 2014.

The present submission of report incorporates the corrections carried out from RN-05 Rev R(3) document submitted in Aug 2014 to incorporate corrections in project cost estimate and traffic growth estimates.

Revision R(4) and R(5) of the document was carried out based on update for land acquisition costs provided by BDA.

GOK has asked BDA to take up the project. Hence, the earlier submitted Detailed Project Report has been modified taking into account the following:

- *Changes in project cross section elements, i.e, width of main road, service road, central median etc.,*
- *Change in pavement composition of main road from rigid pavement to flexible pavement.*
- *Fresh topography survey*
- *Geotechnical report / details at all interchange locations and railway crossing locations. .*
- *Updated Traffic survey and analysis*
- *Revised schedule of rates 2018-2019.*
- *Updated details / surveys for Environmental and Social Impact Assessment.*

This document is submitted to BDA as an advanced information.

-----XXXXX-----

SECTION – 2

TRAFFIC ANALYSIS AND FORECAST

2 TRAFFIC ANALYSIS AND FORECAST

2.1 Background

Bangalore Development Authority (BDA) proposes to develop Peripheral Ring Road (PRR) to Bangalore city between Tumkur road on West and Hosur road on South connecting National and State Highways. The main purposes of construction of PRR are:

- to provide alternate road facility for commercial vehicles and long distance passenger vehicles not having business in the city.
- to create new road network for the city thereby reducing traffic congestion on existing radial roads, their connectivity with existing outer ring road and outer ring road.

Traffic estimate forms an important input in planning, design and deciding the project structuring. Detailed information of traffic pattern and characteristics on existing facility is very important to assess traffic likely to use the new facility.

The consultant had carried out traffic surveys in 2007 at commencement of the project and had submitted reports. Since then, there have been many changes in project concept and project structuring. Further, the traffic scenario has considerably changed since 2007 with shift of airport from HAL to Devanahalli and development of layouts beyond ORR. Hence, it was found necessary to update the traffic statistics to the current year and the consultant had sought directions from Technical Advisory Committee (TAC) of BDA to suggest traffic projections to be adopted for the PRR project. On detailed deliberations, TAC suggested that fresh traffic surveys to be carried out at selected locations. Fresh traffic surveys were carried out in February / March 2012.

The revised traffic survey is carried out in January 2019 as per directions from BDA vide meeting at BDA on 01/12/2019 and at Vidhana Soudha on 06/12/2019. The details and type of traffic surveys was presented to Technical Advisory Committee and BDA and the same was approved on 16/01/2019. The revised traffic analysis is carried out and presented in this report.

2.2 Objectives

As per BDA's revised Terms of Reference for the project, the consultant is expected to determine likely divertible traffic on project road from existing major roads and generated traffic from development of layouts between ORR and PRR and beyond PRR. In general, the basic objectives of the traffic survey are:

- Carry out traffic midblock count at major roads where PRR intersects the alignment.

- Carry out OD surveys for commercial and personalised vehicles.
- Carry out Number plate surveys at the same location of OD stations.
- Determination of Annual Daily Traffic, Seasonal Variation Factor, Peak hour traffic and Annual Average Daily Traffic.
- Estimation of traffic growth based on economic indicators
- Traffic assignment from Origin Destination surveys – mode wise.
- Analysis of OD surveys for commercial and personalised vehicles – desire line diagram, trip details, commodity details, trip purpose, etc.
- Estimation of tollable and non tollable traffic for each category of vehicles.
- Break up of single journey, return journey and monthly pass holders traffic for each category of vehicles.
- Computation of diverted traffic from existing road network.
- Computation of generated traffic based on available CDP considering development of PRR, satellite townships, development of area between ORR and PRR and beyond PRR.
- Preparation of detailed traffic analysis report covering existing traffic and likely traffic on PRR section wise.
- Traffic projections.

2.3 Project Sub-Sections

The project stretch totaling 65.115 Km crosses National Highways at 4 locations. BDA intends to take the project implementation in three sections simultaneously. The project is proposed to be taken up in three sections as given in Table 2-1.

Table 2-1: Project Sections

Stretch No	Starting	Ending	Length, Km
1	Km 0.000 (Tumkur road)	Km 18.367 (Bellary Road)	18.367
2	Km 18.367 (Bellary Road)	Km 36.323 (Old Madras Road)	17.956
3	Km 36.323 (Old Madras Road)	Km 65.115 (Hosur Road)	28.790

2.4 Traffic Surveys

The consultant has carried out various traffic surveys in consultation with client. Key Plan showing locations of various traffic surveys carried out earlier is given in Figure 2-1. Locations for traffic surveys carried out in Dec 2018 / Feb 2019 is given in Figure 2-2. Details of various field surveys with brief description of location are given in Table 2-2.

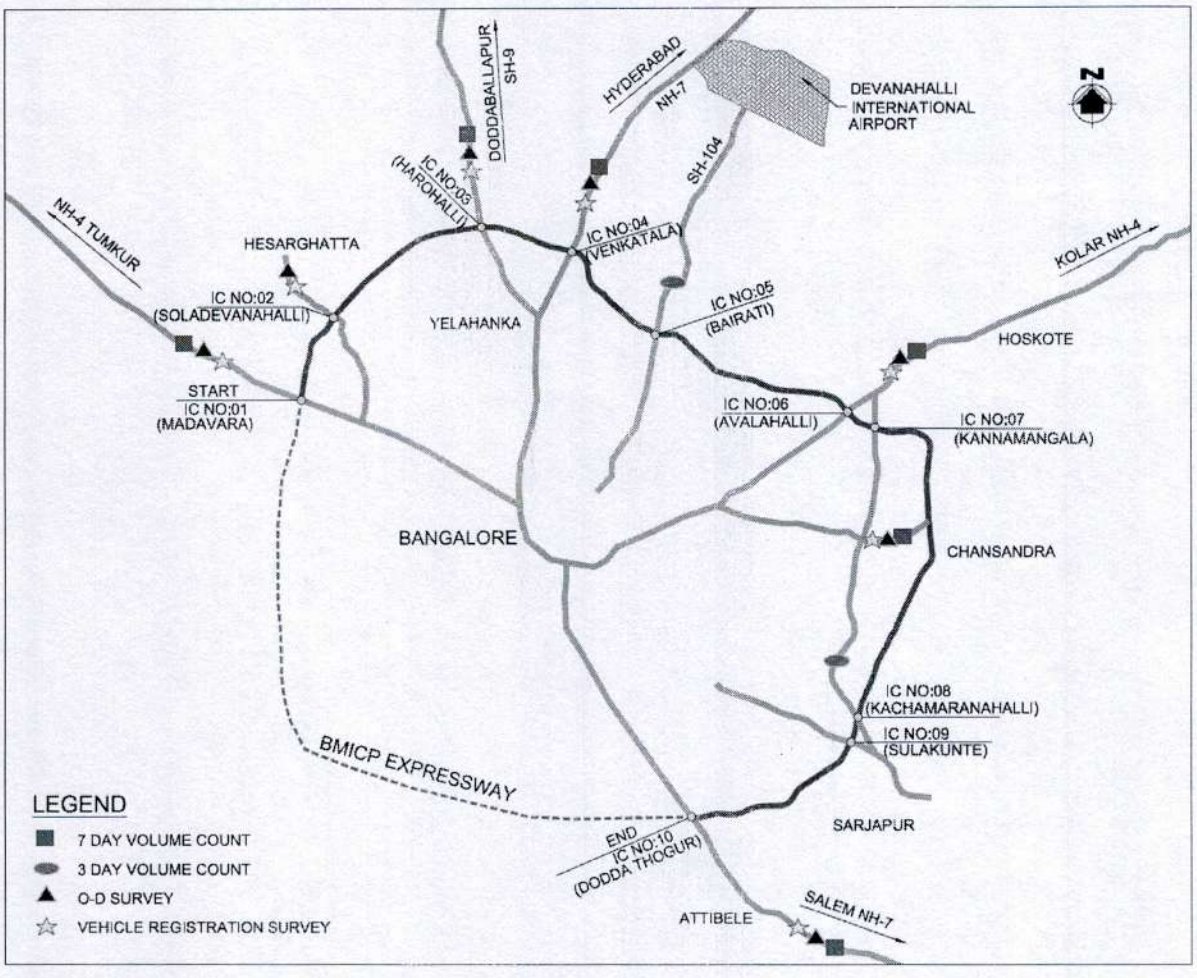

Figure 2-1: Key Plan showing Traffic Survey Locations (2012)

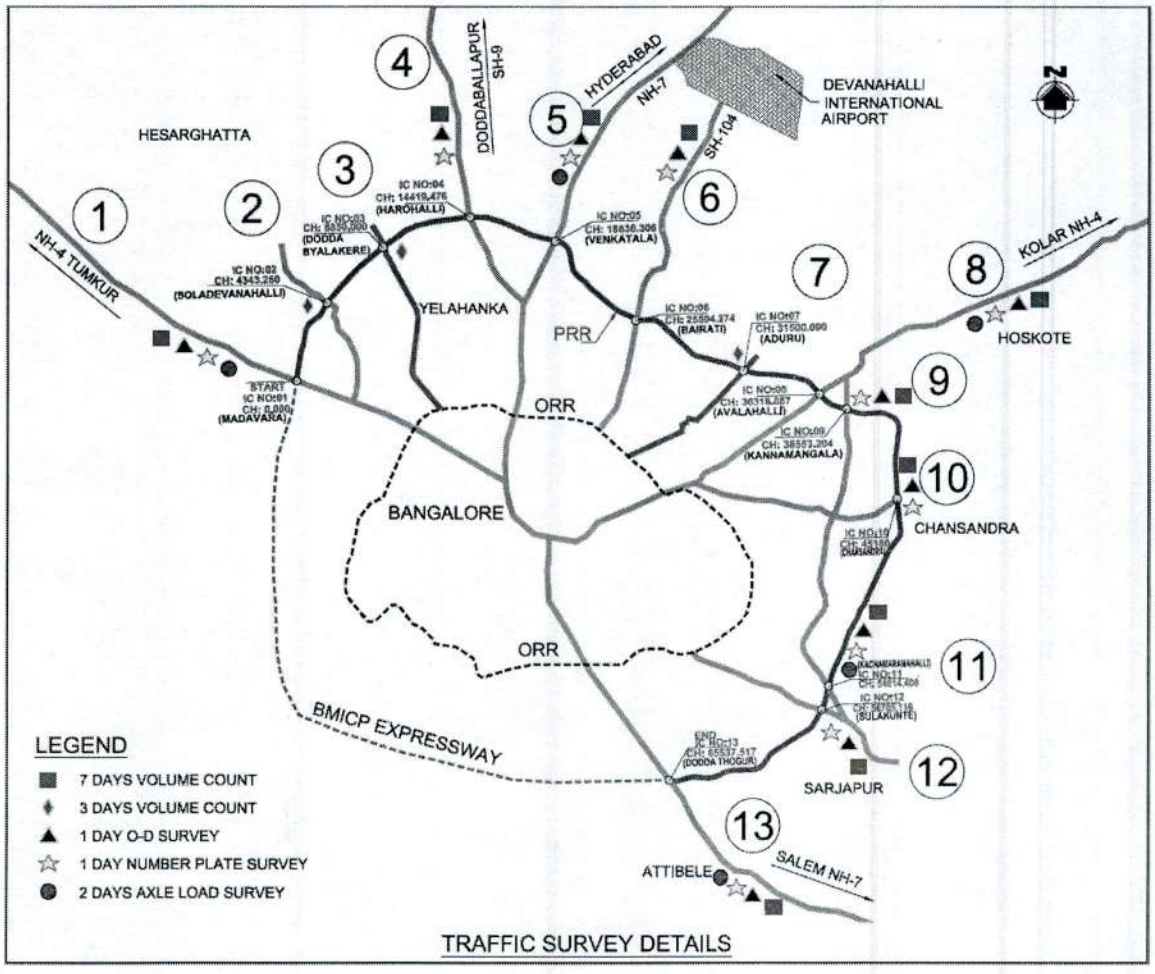

Figure 2-2: Key Plan showing Traffic Survey Locations (2018/2019)

Table 2-2: Traffic Survey Locations (2018/2019)

Sl No	Location	Midblock Count	OD Survey	Number Plate Survey	Axle Load Survey
1	Tumkur road (near Nelamangala Toll Plaza)	7 days count continuous	1 day, 24 hours	1 day, 24 hours	1 day, 24 hours
2	Hessaraghatta Road	3 day continuous	-	-	-
3	IIHR Road	3 day continuous	-	-	-
4	Doddaballapur Road	7 days count continuous	1 day, 24 hours	1 day, 24 hours	1 day, 24 hours
5	Bellary Road (near Trumpet interchange)	7 days count continuous	1 day, 24 hours	1 day, 24 hours	1 day, 24 hours
6	Hennur road (near Kannur)	7 days count continuous	1 day, 24 hours	1 day, 24 hours	-
7	Adur Cross	3 day continuous	-	-	-
8	Old Madras Road (Hosakote, near Toll Plaza)	7 days count continuous	1 day, 24 hours	1 day, 24 hours	1 day, 24 hours
9	Whitefield (near Kannamangala)	7 days count continuous	1 day, 24 hours	1 day, 24 hours	-
10	Channasandra	7 days count continuous	1 day, 24 hours	1 day, 24 hours	-
11	Sarjapura Road (near Dommasandra)	7 days count continuous	1 day, 24 hours	1 day, 24 hours	-
12	Anekal Road (near Marasur Gate)	7 days count continuous	1 day, 24 hours	1 day, 24 hours	-
13	Hosur Road	7 days count continuous	1 day, 24 hours	1 day, 24 hours	1 day, 24 hours

2.4.1 Traffic Analysis - General

The traffic surveys (as per latest proposal) is completed and analysis carried out. These are presented in following sections.

2.4.2 Classified Traffic Volume Count Survey (TVC)

Classified traffic volume counts were taken at locations and for the time period mentioned in Table 2-2. The surveys were conducted between 15-12-2018 and 14-01-2019. The survey was carried out by ATCC. For effective vehicle counts, vehicle classification used in the study were grouped under motorised and non motorised categories. The vehicles passing through the survey stations were enumerated in each direction separately in accordance with the vehicle classification system given in IRC as minimum.

2.4.3 Origin Destination Survey (OD)

Origin and Destination survey was organised for both passenger and freight carriers over a period of 24 hours on a normal working day for the above mentioned locations nearby. Survey was conducted between 28-12-2018 and 18-01-2019. Roadside interview (RSI) method is adopted with random sampling basis obtaining a minimum desired sample size. The objective of the Origin-Destination (O-D) survey is to gather information regarding travel characteristics of different users on the project road. Results of the O-D surveys are used to describe the user characteristics, both for passengers and goods vehicles.

2.4.4 Vehicle Registration Survey (VR)

The number of commercial vehicles with its registration number with / without National Permits and passenger vehicles with registration number will be noted down at the survey location for a period of 24 hours. The data will be used in estimation of commercial vehicles with NP and Passenger vehicles within the city limits based on the registration. These data can be used in estimation of toll revenue based on the policy decision by BDA.

2.4.5 Speed and Delay Survey

Speed and delay survey was carried out by the consultant by moving car method at various sections of existing ORR and radial road networks, where commercial and passenger traffic ply. Summary of journey speed at various sections are given in Table 2-3.

Table 2-3: Speed Profile at various sections

From	To	Route	Journey Speed, Kmph
Mekhri Circle	Trumpet Interchange	Via Hebbal flyover	42.16
Tumkur road (via Gorguntepalya)	Hebbal	Outer Ring Road	18.89
Whitefield	Hebbal	Outer Ring Road	16.71
Electronic City	Hebbal	NICE road	47.92
Electronic City	Hebbal	Central Silk Board, Mekhri circle	16.58
Electronic City	Hebbal	Central Silk Board, KR Puram	15.56

2.5 PCU Factors adopted

The consultant has carried out various analysis from the data collected during field surveys, which are given in this section. Traffic counts of each vehicle type are converted into equivalent Passenger Car Unit using factors given in IRC:106-1990. PCU factors used in the analysis are given in Table 2-4.

Table 2-4: PCU Factors considered

Vehicle Type	PCU Factors for composition of vehicles	
	5%	10% or more
Two Wheeler	0.5	0.75
Auto (passenger)	1.2	2.0
Auto (Goods)	1.2	2.0
Car / Jeep / Van	1.0	1.0
Mini bus	1.4	2.0
Standard Bus	2.2	3.7
LCV (4 wheeler)	2.2	3.7
LCV (6 wheeler)	2.2	3.7
2 Axle truck	2.2	3.7
3 Axle truck	2.2	3.7
MAV (4 to 6 axle)	2.2	3.7

Vehicle Type	PCU Factors for composition of vehicles	
	5%	10% or more
OSV (> 6 axle)	2.2	3.7
Others (HCM / EME)	2.2	3.7
Agricultural tractor	4.0	5.0
Agricultural tractor trailer	4.0	5.0
Cycle	0.4	0.5
Animal drawn vehicles	1.5	2.0

2.6 Analysis of Traffic Volume Count Survey

Traffic volume count surveys carried out and compiled and analysis is carried out to derive the following information:

- Average Daily Traffic (ADT) for fast and slow moving vehicles
- Average Daily variation
- Traffic Composition
- Annual Average Daily Traffic after applying seasonal correction factor

2.6.1 Average Daily Traffic (ADT)

Traffic volume count carried out at selected locations was averaged to determine the Average Daily Traffic (ADT). ADT is classified under tollable and non tollable vehicles and abstract is given in Table 2-5.

Table 2-5: Average Daily Traffic at Various Locations

Vehicle Category	VC-1	VC-2	VC-3	VC-4	VC-5	VC-6	VC-7	VC-8	VC-9	VC-10	VC-11	VC-12	VC-13

2.6.2 Seasonal Variation Factor

Traffic Survey for the project road was carried out between Dec 2018 and Feb 2019. There would be variation in traffic amongst various months of a year. Normally the seasonal variation factors will be arrived based on the past traffic survey at the locations over the year in each month, if details are available. In absence of the month-wise traffic data of past years, seasonal variation factors will be estimated based on the sale of Petrol and Diesel in the study area or sale of fuel at the fuel stations located on the study corridor. For the project, sale of fuel was collected for each month at three different locations covering the project road. Seasonal variation factor for the month when survey was carried out is established as the factor between the sales of petrol / high speed diesel of the month to the average for the year. Summary of seasonal factors for three locations are given in Table 2-6.

Table 2-6: Seasonal Variation Factors Adopted

Month	Petrol Sales	Diesel Sales
January	1.09	1.15
February	1.12	1.18
March	1.01	1.04
April	1.06	1.08
May	0.99	1.06
June	1.03	1.09
July	0.94	0.94
August	0.92	0.87
September	0.87	0.87
October	0.9	0.87
November	1.13	0.96
December	**1.03**	**1.01**

2.6.3 Annual Average Daily Traffic (AADT)

Annual Average Daily Factor is calculated by multiplying seasonal variation factor with Annual daily Traffic. Seasonal variation factors for petrol is used to compute AADT for passenger cars, T/w, Auto and SCF for diesel is used to compute AADT for commercial vehicles and buses. Summary of AADT is given in Table 2-7.

Table 2-7: Annual Average Daily Traffic at various count locations

Vehicle Category	VC-1	VC-2	VC-3	VC-4	VC-5	VC-6	VC-7	VC-8	VC-9	VC-10	VC-11	VC-12	VC-13

2.6.4 Hourly Variation of traffic

Hourly variation in traffic at all traffic count stations reveal that the peak duration in traffic is in the evening between 1600 hours to 1900 hours. Generally, traffic at late evening and early morning is lean. Graphical representation of hourly variation in traffic is given in Figure 2-3.

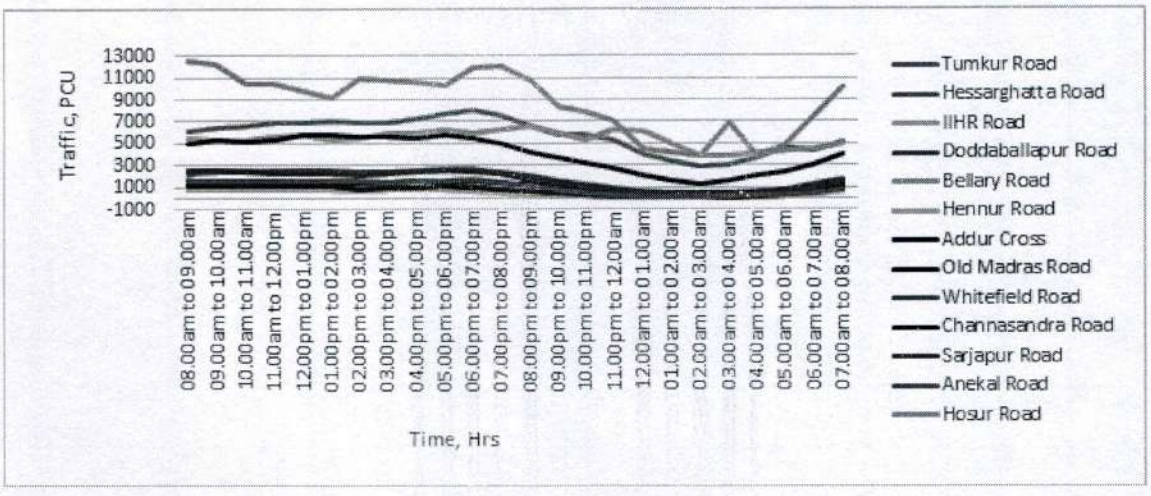

Figure 2-3: Hourly Variation in Traffic at various locations

Variation in traffic between various days of the week is presented in Figure 2-4. There is not much variation between various days of the week.

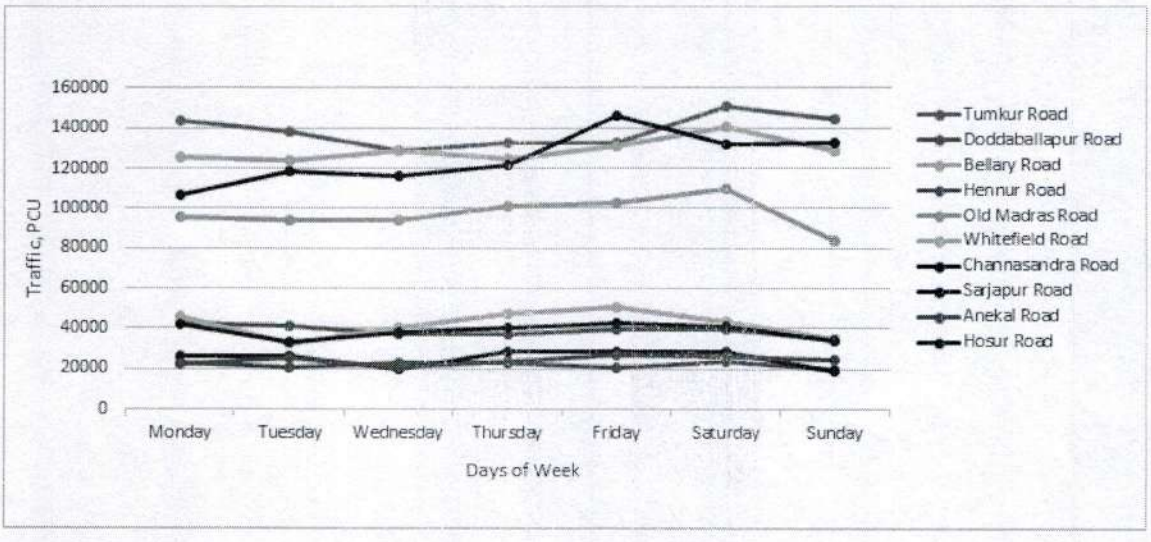

Figure 2-4: Daily Variation in Traffic at all count locations

2.6.5 Traffic Composition

Traffic composition at all traffic count locations are computed from the traffic count and is presented in Table 2-9. Pictorial representation of traffic composition at three homogenous section is given from Figure 2-5 to Figure 2-7.

Following can be inferred:

- Proportion of tollable vehicles various between 64% and 80% at all NHs.

- Passenger car proportion is between 21% and 74% at all locations with 72% at Bellary road.
- Truck proportion on NHs varies between 12% and 21%.

2.7 Origin Destination Studies

2.7.1 General

Origin and Destination survey was organised for both passenger and freight carriers over a period of 24 hours on a normal working day at locations given in Table 2-9. Roadside interview (RSI) method was adopted to capture required information from the vehicle users. The objective of the Origin-Destination (O-D) survey is to gather information regarding travel characteristics of different users on the project road. Results of the O-D surveys are used to describe the user characteristics, both for passengers and goods vehicles which will help in assessing the traffic on the proposed PRR based on the Origin and Destination information gathered during the survey.

2.7.2 Zoning System

For the purpose of the study, in order to estimate the travel pattern, totally 49 zones have been considered. The pre-defined zone indicates the inter-zonal and intra-zonal traffic movement which facilitates in assessing the through traffic on the project road. The zoning system is presented in Table 2-10 and Figure 2-8.

Table 2-10: List of OD Zones Considered

Zone No.	Details of Zones
1	North India (Including J & K, Punjab, Himachal Pradesh, Haryana, Delhi, Rajasthan, Uttaranchal, Uttarpradesh, Jharkhand, Bihar)
2	North Eastern India (Including West Bengal, Chattisgarh, Orissa, North Eastern States)
3	Gujarat, Maharashtra, Goa
4	Uttara Kannada, Belgaum, Dharwad, Hubli, Haveri
5	Bijapur, Gulbarga, Bidar
6	Raichur, Bellary, Koppal
7	Davangere, Sira, Hiriyuru, Chitradurga
8	Mangalore, Udapi, Chikkamagalur, Shimoga
9	Hassan, Chennarayapatna, Kunigal
10	Tumkur City and Sorrounding area, Gubbi, Turuvekere, Tiptur, Chikkanayakanahalli, Koratagere, Madhugiri, Pavagada
11	Dabbaspete, Sompura (Dabbaspete) Industrial Area, Hirehalli Industrial Area
12	T.Begur Industrial Area, Thayamagondlu Industrial Area (between Nelamangala and Dabbaspete)
13	Nelamangala and surrounding areas towards Bangalore
14	Doddaballapur, Hindupura, Gouribidanur
15	Yeshwanthpur, Subedarpalya, (Ashoknagar), Aswathnarayanapura, Gokul Extension, Lottegollahalli, Mattikere, Indian Institute of Science, Medarlinganahalli, Dyavasandra, Divanarapalya, Kempegowda Tower, Rajamahalvilas extension, Sadashivanagar extension, Geddalahalli, Nagashettihalli, Purnapura
16	Yelahanka, Rajanakunte
17	Devanahalli, Srinivasapura, Chintamani, Siddlagatta, Chikkaballapura, Bagepalli
18	Bangalore International Airport

Zone No.	Details of Zones
19	Banasavadi RS, Ramaswamipalya, Kammanahalli, Saitpalya, Kariyannapalya, Venkateshpura, Ashokanagara, East RS, Kadrampalya, Cox Town, Cooke Town, Munireddipalya, Sagayapuram, Periyarnagar, Ambedkarnagar, Ramnatanagara, Mattadahalli, Cholanayakanahalli, Ramnatanagara, Dinnuru, Sultanpalya, Govindapura, Annaiyappa Block, Shampura, Lingarajapuram, Kaval Byrasandra, Kadugondanahalli, Kacharakanahalli, Hebbal, Devarajivanahalli, Chikka Banasvadi, Krishnaiyanpalya, Krishnamurthynagara, Baiyyappanahalli.

2.7.4 Details from OD Survey

Based on the road side interview survey at important locations, information related to trip purpose for personal and commercial vehicles, loading pattern of commercial vehicles and commodity movements are computed. These are given from Table 2-12 to Table 2-15Table 2-15.

Table 2-12: Distribution of Vehicle Trips – Trip Purpose

2.7.5 Desire Line Diagram

The origin destination details collected during the survey was on sample basis w,r,t total traffic movement during the day of the survey. Hence, it is necessary to raise / increase the proportion to reflect the total vehicle trips during the day. Hence expansion factors are calculated for each vehicular class.

The collected data during the survey has been grouped according to the zones mentioned above. With this predefined zones, the origin-destination matrices have been prepared for individual type of vehicles for all locations of survey.

In order to assess the influence of each zone on its traffic attraction and production of trips, the influence factors have been calculated for each vehicle type. Influence factor indicates the importance of the zone in the study area. The details of influence factors for all the vehicle types are given in Table 2-16.

Desire line diagrams for various categories of vehicles are given from Figure 2-9 to Figure 2-13.

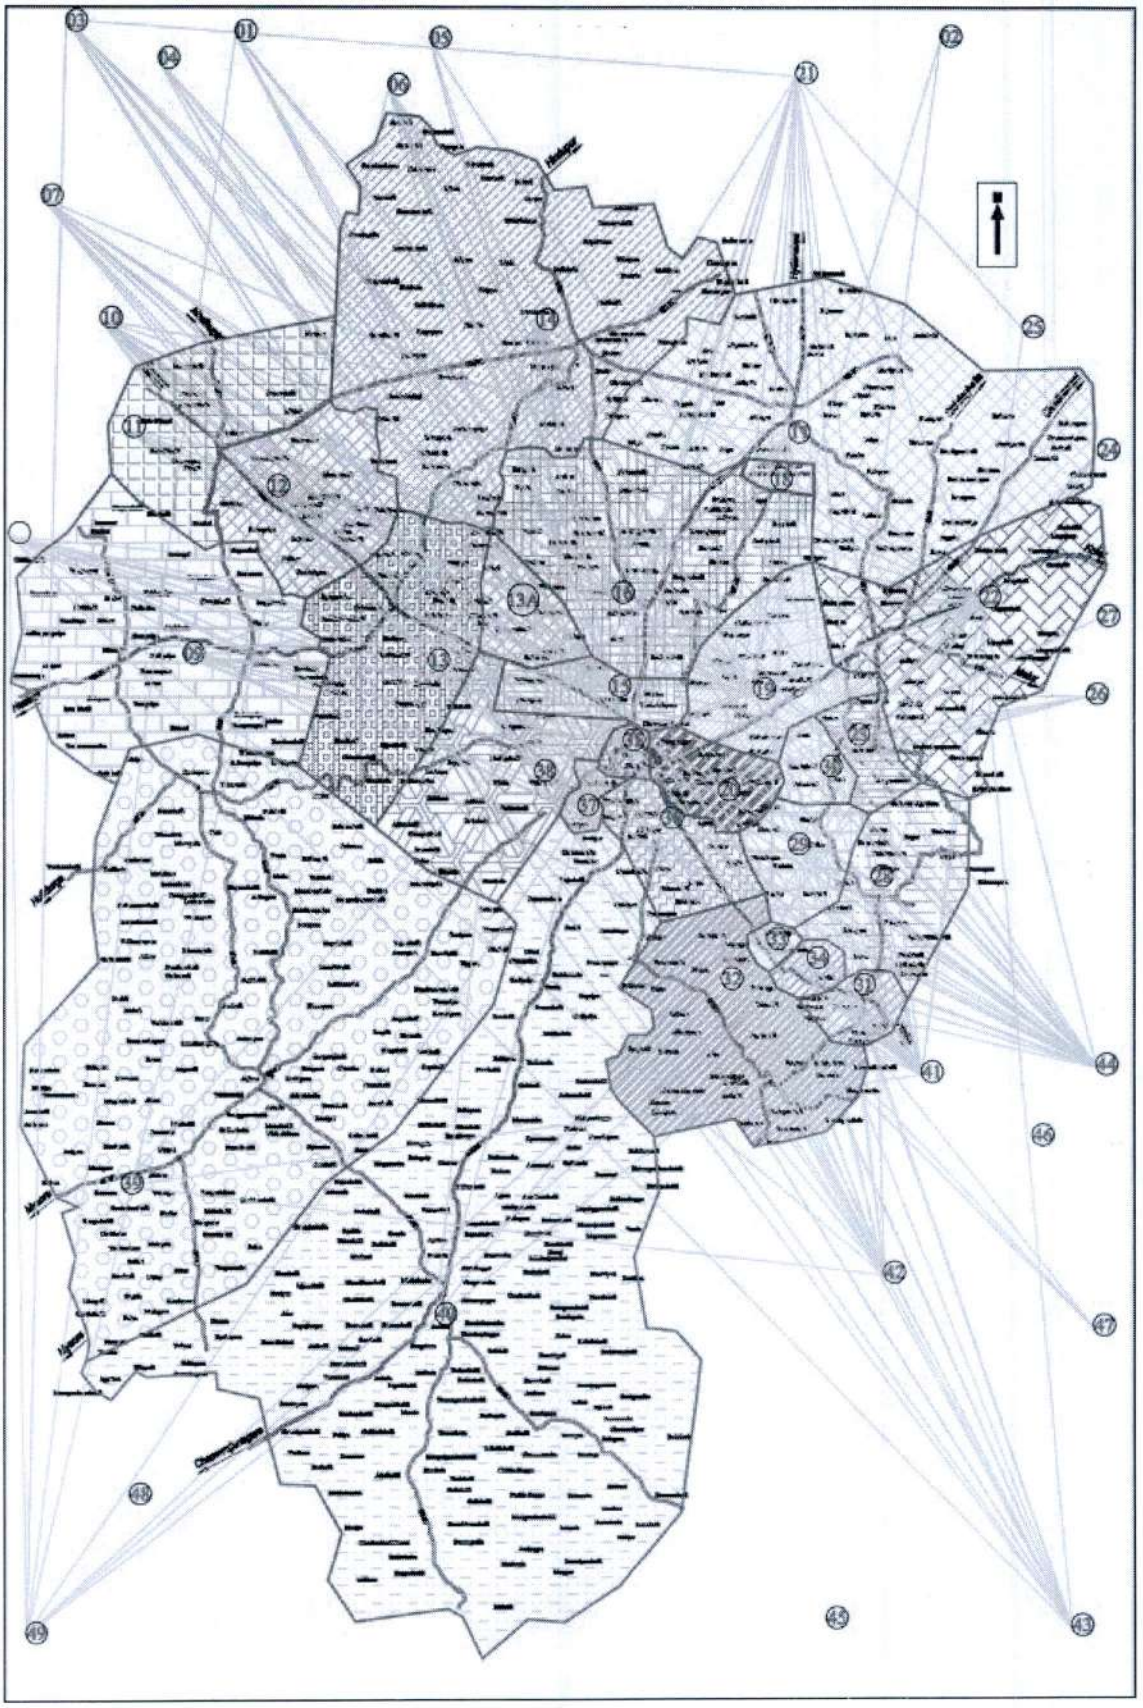

Figure 2-9: Desire Line Diagram for 2 Axle Truck

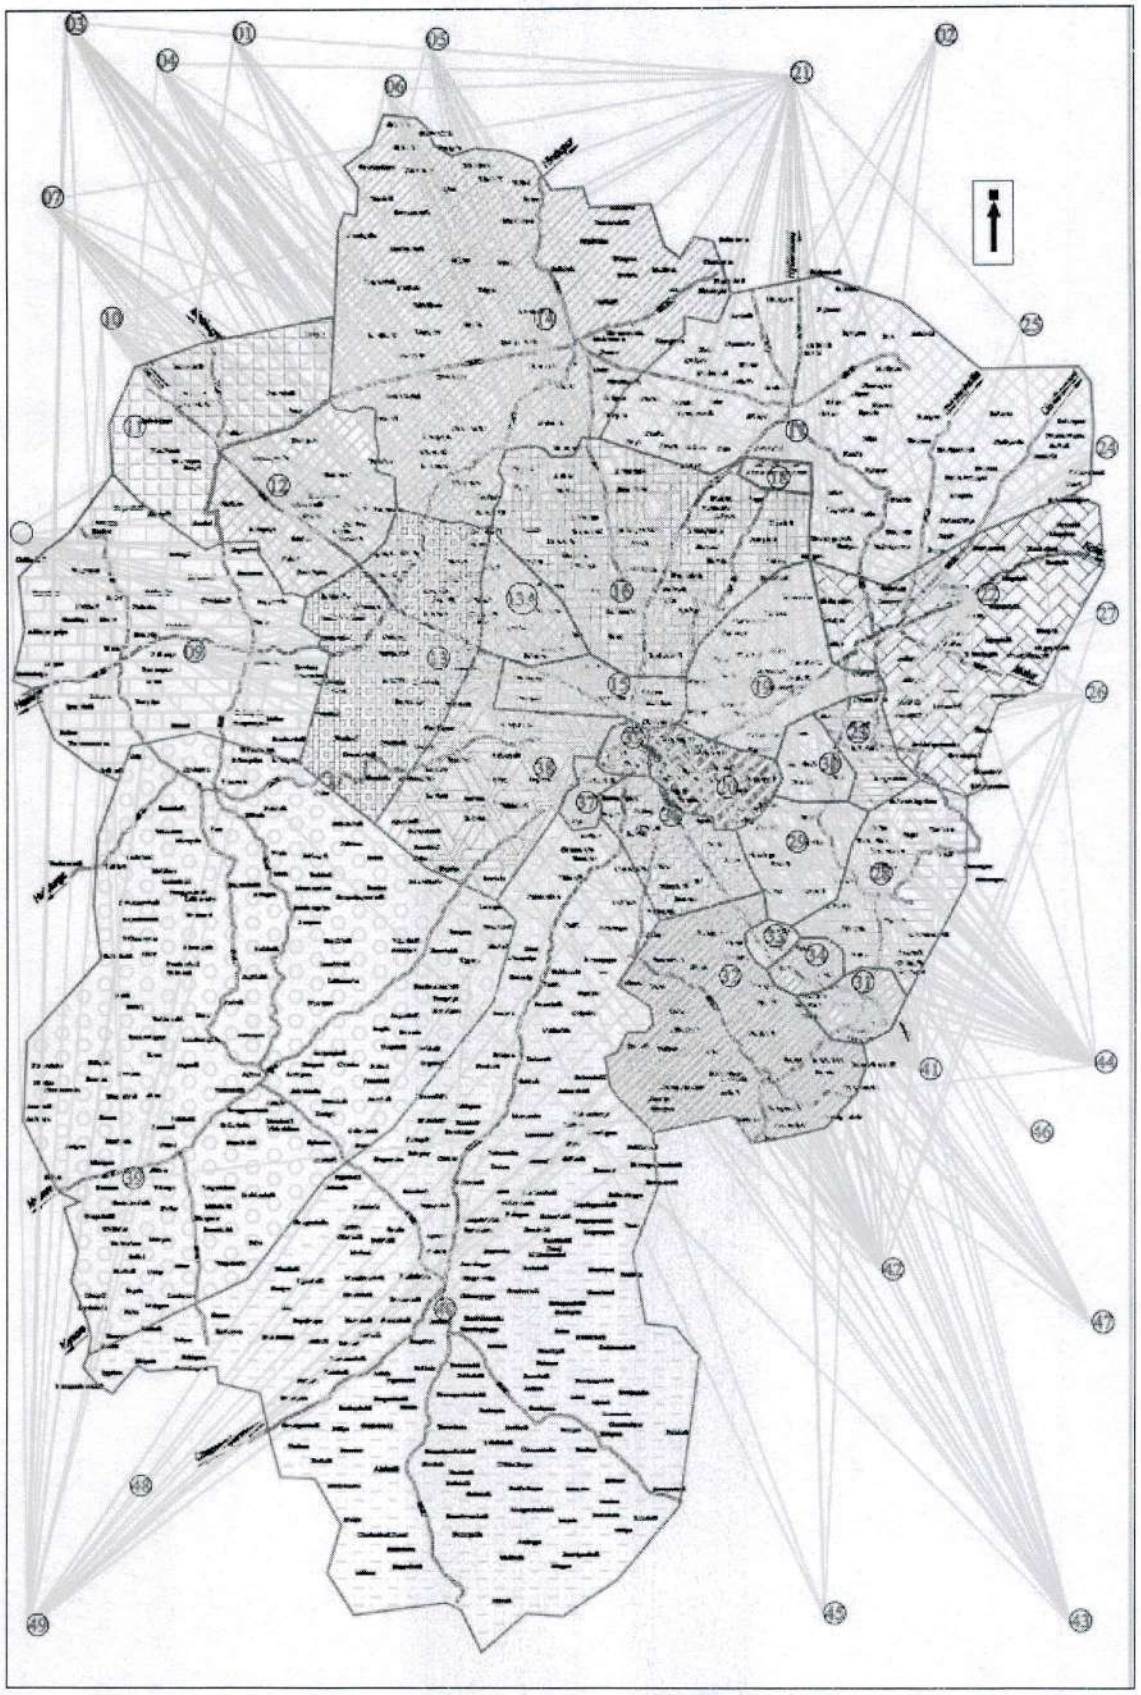

Figure 2-10: Desire Line Diagram for 3 Axle Truck

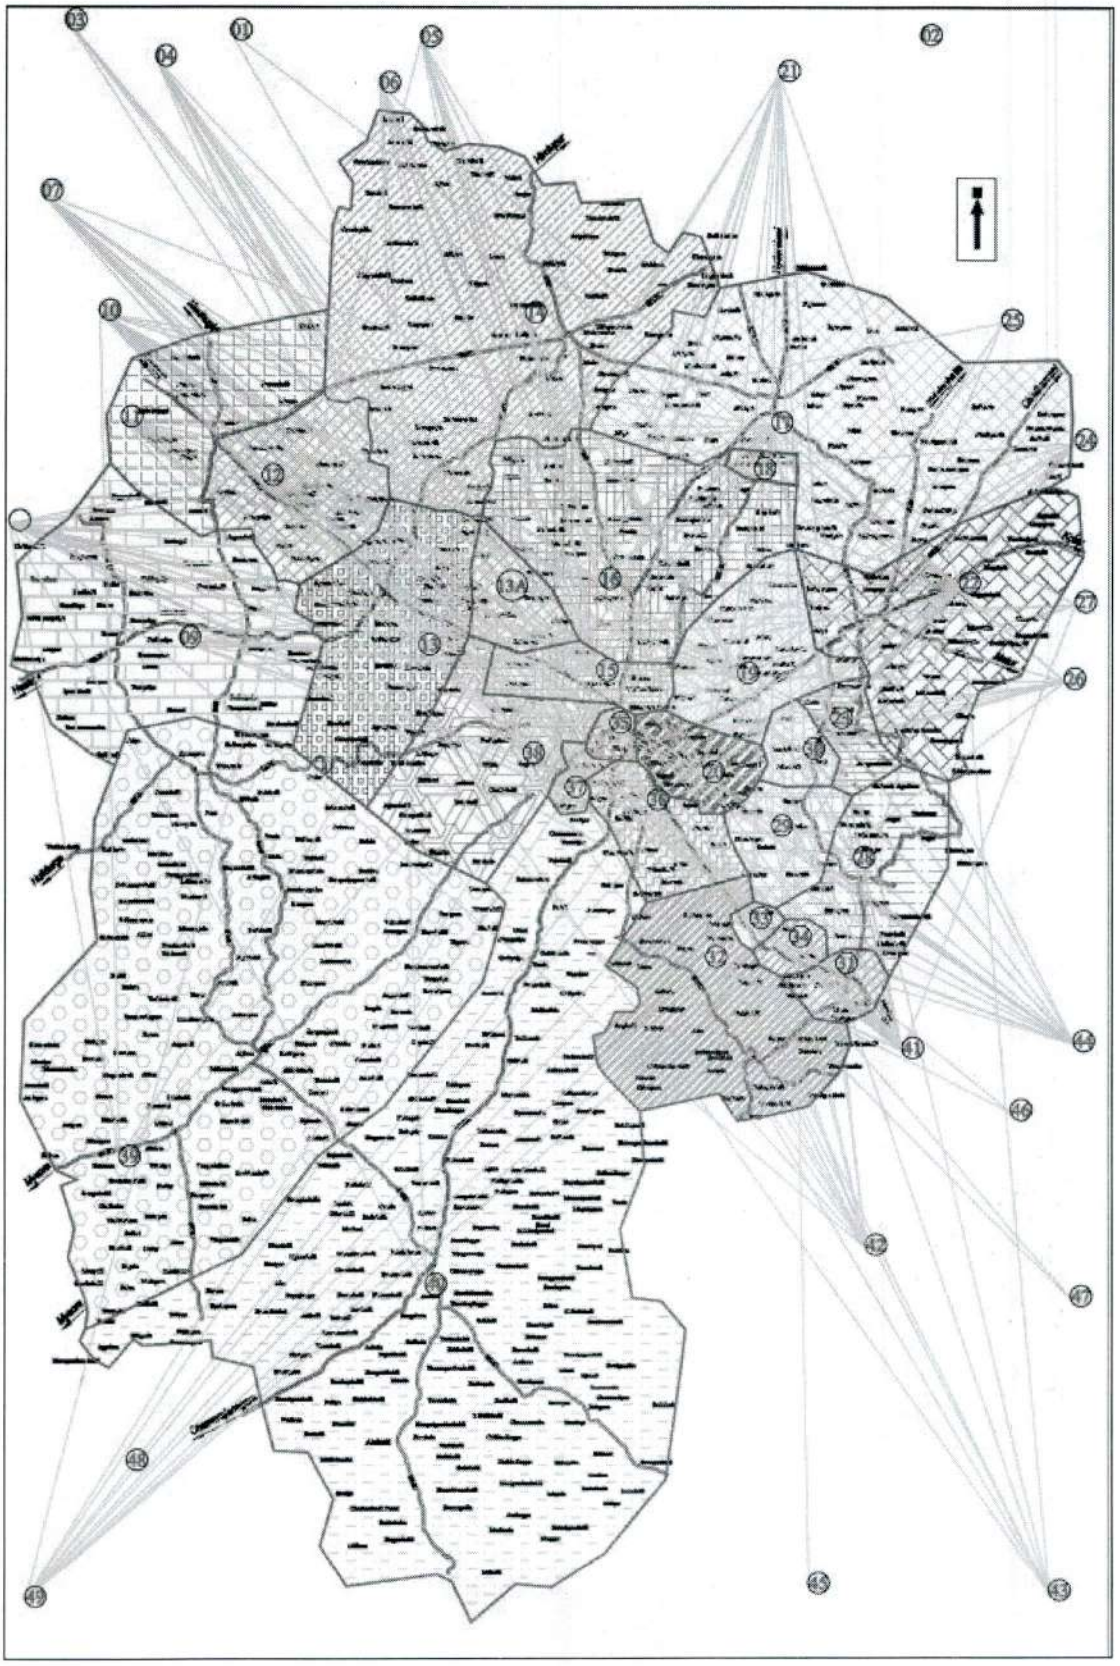

Figure 2-11: Desire Line Diagram for Car (yellow)

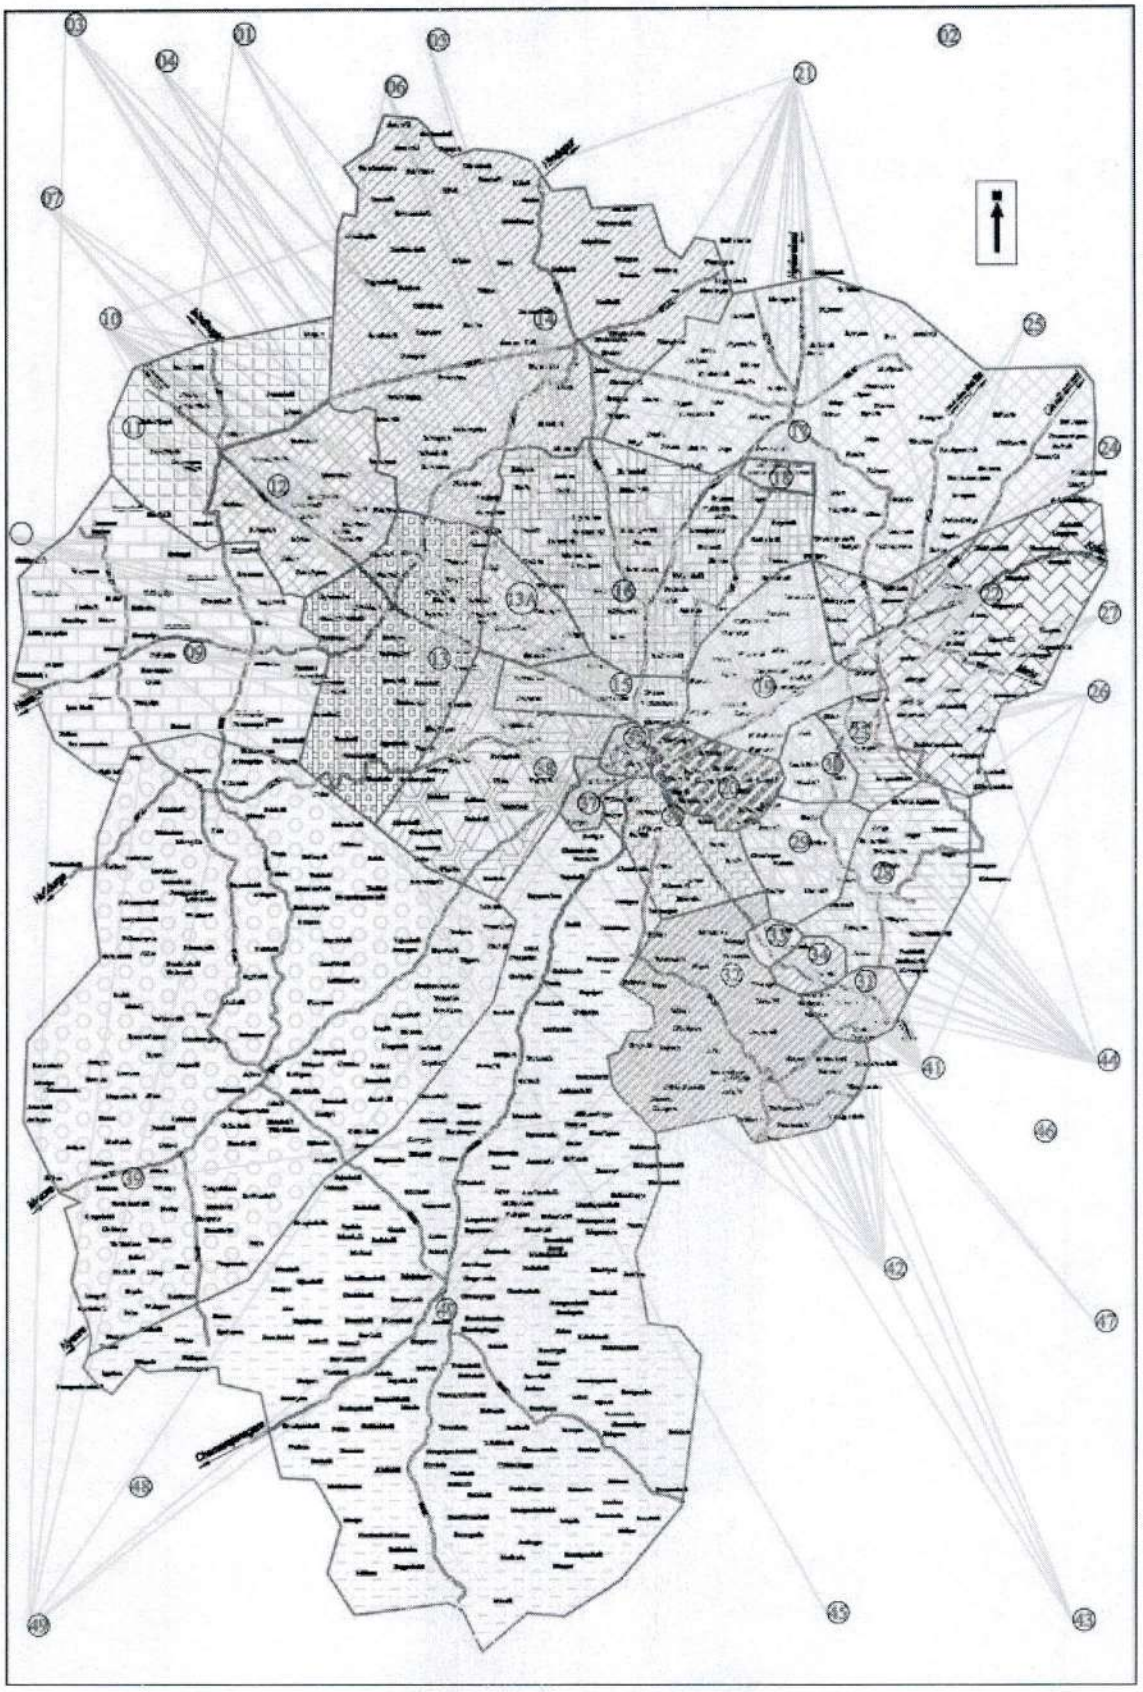

Figure 2-12: Desire Line Diagram for LCV

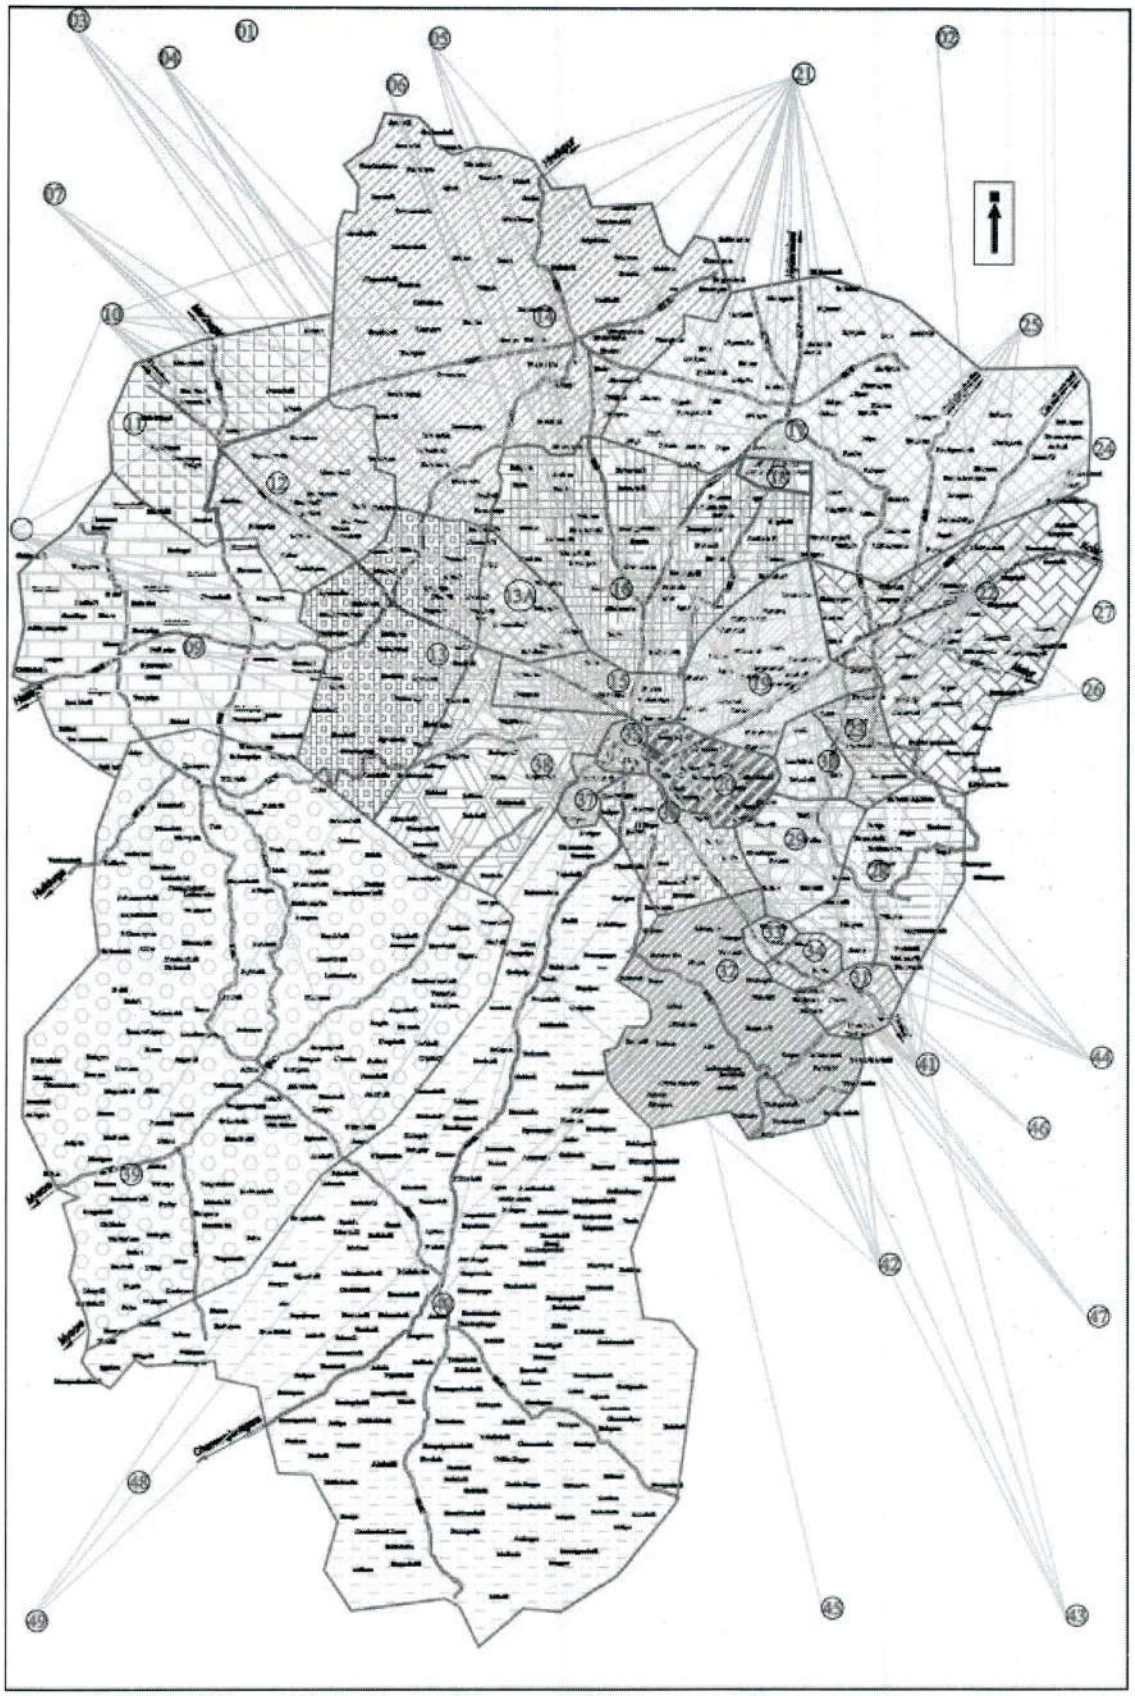

Figure 2-13: Desire Line Diagram for Bus

2.7.6 Influence Factors

In order to assess the influence of each zone on its traffic attraction and production of trips, the influence factors have been calculated for each vehicle type. Influence factor indicates the importance of the zone in the study area. The details of influence factors for all the vehicle types are worked out and the summary is given in Table 2-16.

Table 2-16: Influence Factors from OD

Rest of Karnataka	7.07%	1.99%	4.72%	6.69%
Total	100%	100%	100%	100%

Following can be inferred:

- Influence of Karnataka in origin and destination of all classes of vehicles are very significant at all locations except at Hosur road.
- Due to close proximity to Tamilnadu on southern side, influence of Tamilnadu is seen at Hosur road.
- Influence of Andhra Pradesh as major attraction zone is seen on Doddaballapur and Bellary side as they link to AP beyond Karnataka.

2.7.7 Traffic Assignment on Project Road

The proposed PRR is on the outskirts of the city at a radial distance varying between 17 Km to 25 Km. Hence the traffic pattern on the proposed road is influenced by following two factors:

- Diverted traffic from major radial roads intersecting PRR like Tumkur road on west, Dodaballaupur road on North-West, Bellary road on North, Hennur road on North-East, Old Madras road on East, Whitefield road, Hosakote - Anekal road and Bangalore - Sarjapur road on South-West and Hosur road on South.
- Traffic likely to be generated due to developments of area as per BDA's Master Plan between existing Outer Ring Road and PRR, around and beyond PRR.
- Existing NICE road connecting Tumkur Road on west and Hosur road on south (~ 44 Km) which is used by commercial vehicles without entering the city.
- NH-207 (Dabaspete – Doddaballapur – Hosakote) provides direct connectivity between Tumkur road on west and Bellary road on north and Old Madras road on east. Commercial and passenger traffic would use this road rather than passing through PRR.

2.7.8 Summary of Number Plate Survey

Number Plate survey is conducted at existing National Highways for a period of 24 hours on a wording day. The survey comprised of noting down:

- Registration numbers of all commercial vehicles along with permit status (National Permit / Non National Permit).
- Registration numbers of all passenger vehicles passing though the stretch.

Proportion of passenger vehicles with local registration is given in **Table 2-17**.

Table 2-17: Passenger Vehicles with Local Registration

Vehicles	Passenger Car (White)	Passenger Car (Yellow)	LCV - Passenger
Tumkur Road	73.84%	72.73%	75.71%
Dodaballapur Road	83.73%	78.18%	81.08%
Bellary Road	72.66%	81.25%	78.41%
Hennur Road	87.23%	88.81%	70.00%
Old Madras Road	76.24%	80.31%	75.84%
Whitefield Road	81.33%	78.70%	82.98%
Channasandra Road	88.72%	84.88%	84.78%
Sarjapura Road	84.51%	84.69%	81.65%
Anekal Road	84.65%	85.67%	88.89%
Hosur Road	55.81%	66.77%	63.57%

Proportion of commercial vehicles with local registration and without National Permit is given in Table 2-18.

Table 2-18: Non NP Commercial Vehicles with Local Registration

Vehicles	Bus	LCV - Goods	2 Axle Truck	3 Axle Truck	Multi Axle Truck

Hosur Road	47.66%	48.82%	37.71%	40.53%	21.11%

2.7.9 Break up of Toll type

Trip details are collected during Origin Destination surveys. The details obtained from the survey are categorised to compute tollable vehicles making single trips, return trips, vehicles preferring monthly passes at 4 locations. Summary of toll details are compiled section-wise and presented in Table 2-19.

Table 2-19: Summary of Toll Details

Toll Trip Particulars	Section-1			
	Single	Return	Monthly	Exempted
Passenger Cars (Pvt)	56%	32%	9%	3%

2.7.10 Origin Destination Pattern

Based on the OD surveys, commercial and passenger traffic are assigned to various zones of their origin and destinations. Traffic likely to ply on PRR, either for full stretch or for part length is summarised in Table 2-20.

Table 2-20: Contributing OD Zones for PRR Traffic

Origin	Code	Destination	Origin Code	Destination Code
Tumkur Road - A	A	Tumkur Road	-	-
	B	Hesaraghatta Road	1 to 12,15,38,39,40,48,49	13
	C	Doddaballapur Road	1 to 12,15,38,39,40,48,49	14,21

2.8 Traffic Assignment on PRR

Proposed traffic likely to get diverted from existing major roads are worked out based on OD pattern. The proposed road will have entry / exit points at 10 locations (only entry at Hessaraghatta towards Hosur) and toll plazas will be located at each entry and exit points. Traffic entering at various origin points are assigned to destination and OD matrix is developed. This will be the "Base Diverted Traffic Stream".

2.9 Considerations

The proposed PRR alignment will be at a radial distance of 17 to 22 Km from Bangalore city. It is expected that long distance personalised traffic and commercial vehicles plying on National and State highways will get diverted onto PRR instead of passing through existing

Outer Ring Road which is already congested and has become part of city road. There are other agencies which are either planning / implementing other road developments which may have bearing on the PRR traffic. These are reviewed in following sections.

2.9.1 Existing NICE Road

All commercial (truck) traffic between Hosur road and Tumkur road use existing NICE road between Tumkur road and Hosur road. The NICE road alignment from Madanayakanahalli to Electronic city is ~ 44 Km long crosses Magadi road, Mysore road, Kanakapura road, Bannerghatta road. NICE road is divided 4 lane road without service road. In addition to truck traffic, passenger car traffic having destination on south / south-west part of Bangalore city uses this road. This is in addition to existing ORR between Gorguntepalya junction and CSB junction. Hence, in the traffic assignment this prevailing traffic movement is considered.

2.9.2 Effect of NH-207

National Highway Authority of India (NHAI) is implementing widening of existing 2 lane road to 4 lane facility between Dabaspete and Hosakote section of NH-207. Start point of NH 207 is located at a distance of ~ 32Km from PRR on Tumkur road end and ~ 6 Km on Old Madras Road end (ref Figure 2-14). Following are inferred:

- the distance travelled between same points on Tumkur road and Old Madras road are generally the same (81 Km via NH-207 and 79 Km via PRR).
- PRR is proposed to be completely access controlled facility for main road traffic with access to entry / exit main road at only 4 points excluding termination points. Whereas, NH 207 is proposed to be partially access controlled facility.
- NH-207 is proposed with bypasses for ~ 50% of the total length of the project and hence local interference will also be substantially less for main road traffic.
- Hence, in the analysis, traffic between Tumkur and Old Madras Road direction is assumed to use NH-207 instead of travelling on PRR.

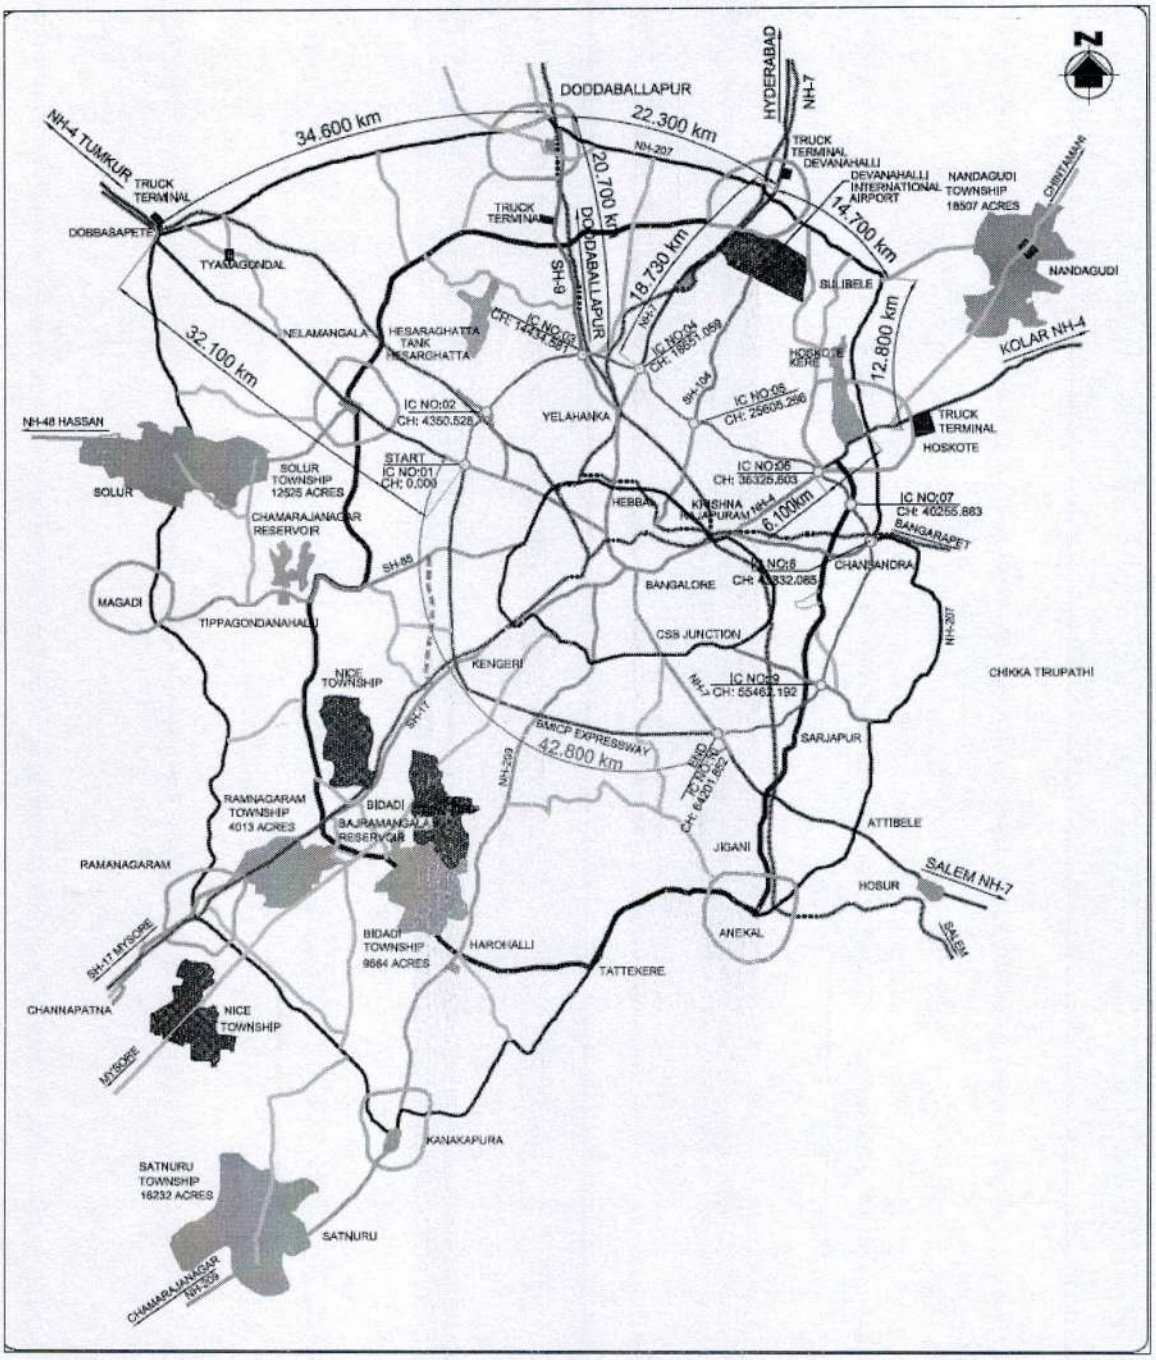

Figure 2-14: Key Plan showing PRR along with NH-207

2.10 Generated Traffic

On completion of Peripheral ring road between Tumkur road and Hosur road, the area between existing ORR and PRR, and area beyond PRR will generate traffic on account of development of layouts by both private and Government agencies. Comprehensive Development Plan for the city of Bangalore has identified various development mix in and

around Bangalore city. Key Plan showing various planning districts through which PRR pass is given in Figure 2-15.

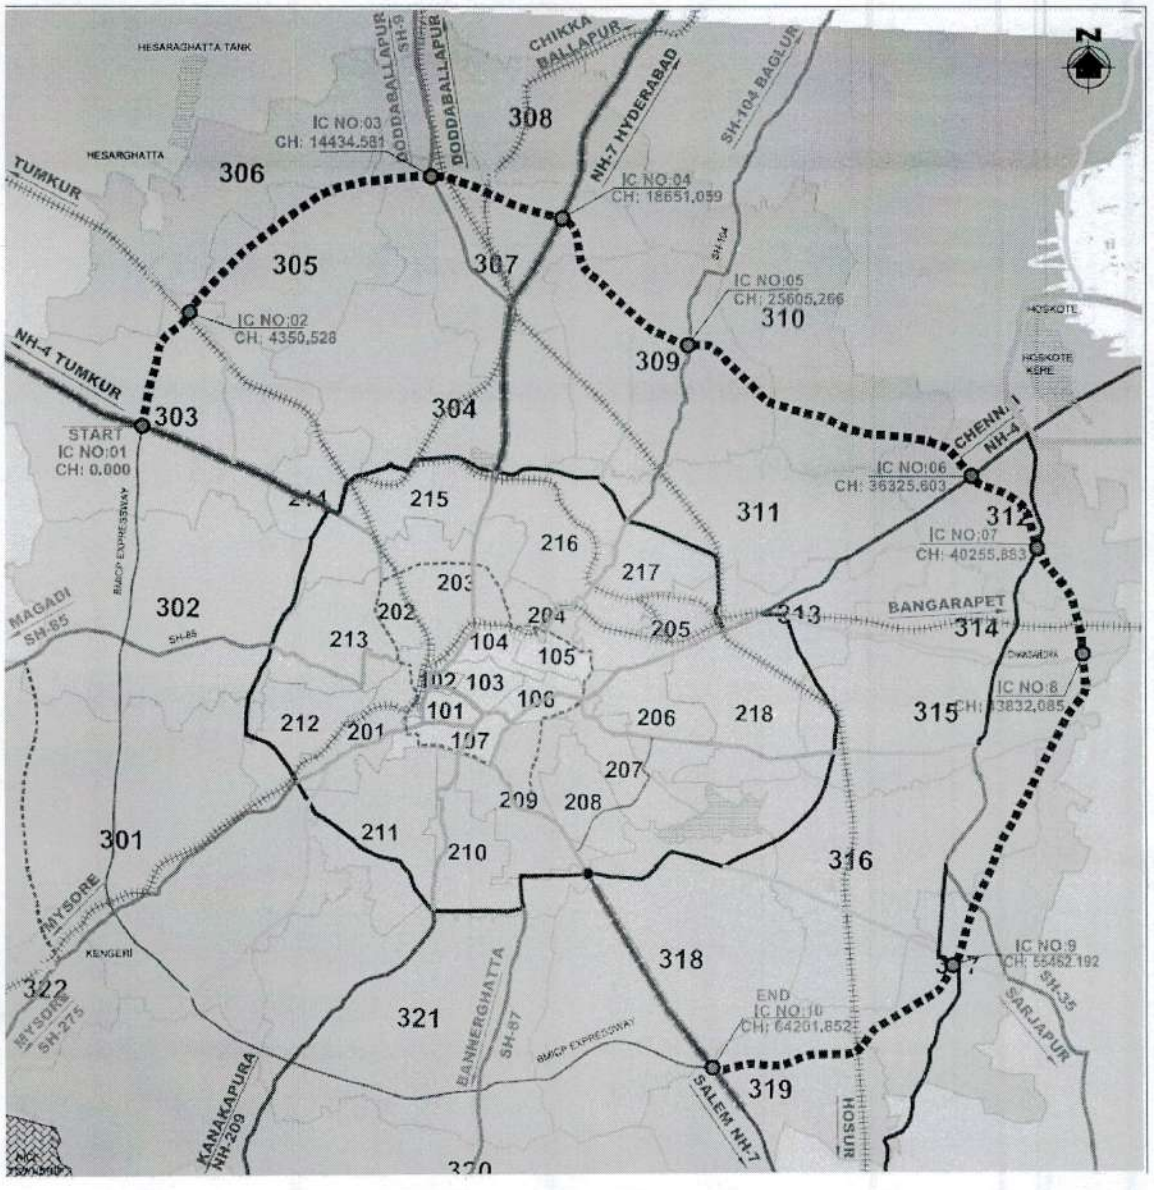

Figure 2-15: Key Plan showing various planning districts through which PRR pass

Traffic generated on account of development of various layouts from planning districts are worked out based on following parameters and assumptions given in Comprehensive Traffic and Transportation Plan for Bangalore.

- Per Capita Trip Rate of 0.924 is used as given in Table 3.11 of CTTP.
- Existing travel pattern split as per Table 3.2 of CTTP will be Bus (45.72%), Rail Transport (0%), Car (7.22%), T/w (32.03%), IPT (12.61%) and Cycle (2.4%).

- Proposed travel pattern split as per Table 6.6 of CTTP will be Public Transport (bus/ metro) (69.8%, T/w (18.7%), Auto (8.1%) and Car (3.5%)
- Passenger Car Unit equivalent for various vehicles are used as given in Table 4.3 of CTTP.
- Occupancy rate of vehicles as per Table 4.3 of CTTP are car (8), Bus (55), T/w (1.53), Car (2.59), Bicycle (1), Auto (3), Mini Van (25), LCV (3) and Truck (3) are used.
- Of the total generated traffic, buses, t/w auto, bicycles and some proportion of cars will use service road.
- Out of total generated traffic, only 50% of the traffic is assumed to ply along PRR while remaining traffic will continue to use existing radial roads and outer ring road to reach various parts of the city.

Since the distance of proposed Peripheral ring road is just around 15 Km from the city (5-7 Km from ORR), the entire area beyond existing Outer ring road upto and beyond proposed PRR has developed with residential layouts, educational institutions and few commercial developments all along. BDA, as part of their master plan is also intending to develop various layouts around the city as per details given in Figure 2-16. The traffic likely to be generated on account of layouts are slow moving and car traffic.

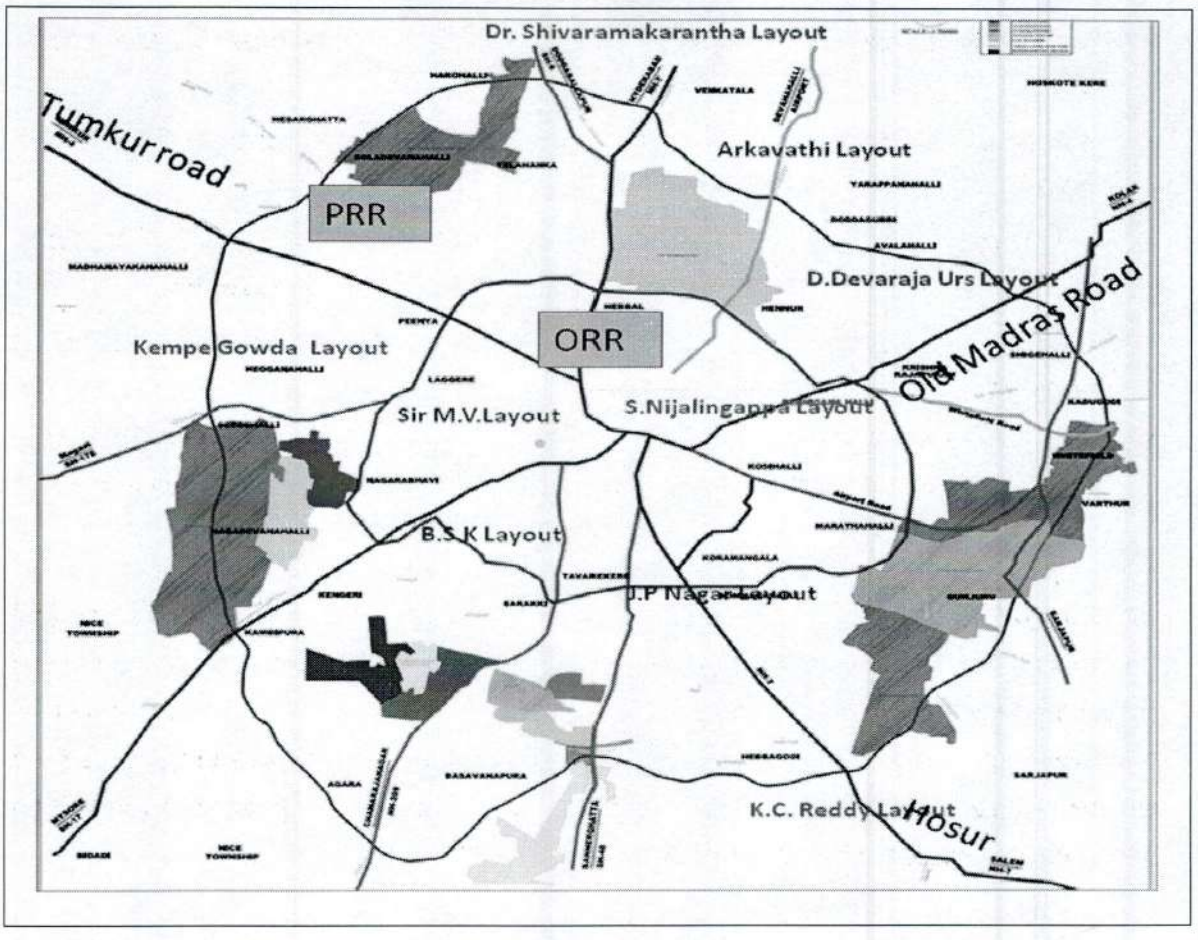

Figure 2-16: Proposed layouts in and around PRR

2.10.1 Project Road Traffic

Proposed traffic at various sections on PRR are computed as follows:

- (1) - Base Traffic from OD Matrix
- (2) - Reduction in Traffic between Electronic city (south) and Madanayakanahalli (west)
- (3) - Reduction in traffic on account of NH 207 / STRR
- (4) - Generated Traffic on account of development of various layouts

PRR Traffic = 1 - 2 - 3 + 4

The total traffic on PRR is computed section-wise (for three homogenous section and is given in Table 2-21, Table 2-22 and Table 2-23 respectively. It may also be noted that even though toll plazas were proposed at 13 locations on PRR, considering the traffic entry and exit at these locations and proximity to adjoining toll plazas, toll plazas are proposed at only 10 locations. The detailed were presented to Technical Advisory Committee 4th meeting on 05/10/2019 and were approved.

2.11 Traffic Growth Rates

Investment priorities are governed by the traffic demand, estimated benefits and cost of the project. Hence, prediction of traffic demand estimate assumes very significant role in investment priorities. Traffic growth on a road facility is generally estimated on the basis of statistical data and historical trends. In the present case, traffic growth for the project road is estimated using econometric method given in IRC:108-1996.

From the origin destination studies, the project stretch is mainly influenced by adjoining states of Andhra Pradesh (west) and Tamilnadu (on south). Hence, available statistics of both the states and Karnataka is used in estimation of traffic growth rates.

2.11.1 Econometric Method

Given the inconsistencies and absence of accurate past traffic survey data, in this method, the vehicle registration data has been correlated with NSDP. Motor vehicle registration trends of Karnataka have been considered in estimating the traffic demand elasticity. The independent variables are socio-economic parameters. The choice of independent variable depends upon vehicle type under consideration. This method involves a logarithmic regression between two variables and is of the form.

$$\text{Log e } P = Ao + A1 * \text{Log e NSDP}$$

Where,

- P = Vehicle Registration Data
- Ao = Regression Constant
- A1 = Elasticity Coefficient
- NSDP = Net State Domestic Product (economic indicator)

Finally the, after the regression analysis, the elasticity values obtained for each type of vehicle will be multiplied by the average economic growth of the region.

$$Tg = Eg * e$$

Where, Tg is Traffic Growth Rate

Eg is Economic Growth Rate for the Region

"e" is the Traffic Demand elasticity

Traffic growth rates are estimated by multiplying traffic demand elasticity of particular vehicle type with average economic parameter of the region.

2.11.2 Past Vehicle Registration Details

Vehicle registration data of Karnataka, Tamilnadu, Andhra Pradesh – Telangana and Kerala states are collected from various sources and is presented in Table 2-24.

Table 2-24: Vehicle Registration details

2.11.3 Economic Indicators

Traffic growth on the project road is generally influenced by development prevailing in the influence area. The time series data of economic parameters like National State Domestic Product (NSDP), state population, Per Capita Income (PCI) of influence states and Gross Domestic Product (GDP) at constant (2004-2005) prices published by Central Statistical Organisation are collected to determine the elasticity of influencing states and is given in Table 2-25.

Table 2-25: Few Economic Indicators at (2004-05) Constant Price

2.11.4 Elasticity

Regression analysis is carried out between vehicle type and economic parameters with vehicle type as the dependent variable (Y axis) and Economic parameters as independent variable (X axis). Linear regression analysis is carried out on natural logarithm of both parameters. The extent by which both parameters correlate with one another is determined by R2 value tending towards 1.0. Closer the value tending towards 1, better is the correlation.

Linear regression analysis is carried out for GDP, NSDP, PCI and Population with various vehicle classes. The elasticity values corresponding to PCI and Population is considered for Passenger Cars and Buses. NSDP and GDP values are considered for LCV, Trucks and MAV. Details of elasticity values and adopted growth rates are given in Table 2-26.

Table 2-26: Elasticity Values for various indicators

Passenger Cars					
State	Indicators	Elasticity Value	R2	Growth Rate, %	Adopted Growth Rate, %
Karnataka	PCI	0.684	0.898	5.03%	10.93%
	Population	7.483	0.997	10.93%	
Andhra Pradesh - Telangana	PCI	0.423	0.817	2.28%	10.20%
	Population	9.734	0.852	10.20%

2.11.5 Review of available past traffic data

The consultant had carried out traffic census at 4 National Highway road very close to proposed PRR alignment in 2007. Traffic revalidation survey is also carried out in 2012 to update the traffic numbers. Fresh traffic surveys were carried out in Jan 2019. Comparison is made between traffic numbers between 2007, 2012 and 2019 and average growth rates are worked out. These are given in Table 2-28.

Table 2-28: Comparison of Traffic between 2007 and 2019

Tumkur road				
Vehicles	2007	2012	2019	CAGR,%
Car	11457	17834	43891	21.2%

Total Trucks	6440	9241	15814	13.7%

2.11.6 Comparison of Growth rates

Registered traffic data based on Regional Transport Office (R.T.O) of Bangalore city (urban and rural) are collected (ref Table 2-29). The average growth rate for various classes of vehicles are computed. Details are given in Table 2-30. The registered vehicular growth for various category of vehicles varies in rural and urban areas significantly except in the case of Taxis. Car growth is 10.1% in urban whereas 5% in Bangalore rural. Growth of LMV is 5.5% in Bangalore Urban whereas is is 2.1% in rural section. Bus and Trucks growth is 8.1% and 6.6% in Bangalore urban as against 12.4% and 4.4% in Bangalore Rural. Hence, it is difficult to estimate the traffic growth of PRR project based on vehicle registration data alone.

Table 2-29: Vehicle Registration Details

Vehicle Registration Details Category wise (**BENGALURU URBAN** as on March 31st)								
Sl. No.	Category of vehicles	2012	2013	2014	2015	2016	2017	2018

S

2.11.8 Traffic Growth – Generated Traffic

Generated traffic generally comprises of T/w, auto, passenger cars and buses due to the development of layouts and its requirement for connectivity to adjoining areas and Bangalore city. Personalised vehicular growth may show an increasing trend at initial stage and then start declining. The proposal for other transportation facilities like metro / mono rail will also be a major consideration in traffic growth in and around PRR after some period when PRR is implemented.

The traffic likely to be generated on account of layouts are slow moving and car traffic. Of the traffic generated from the layout, small proportion of passenger cars and commercial vehicles will use main road of PRR. In a report submitted to BDA, it is found that based on the study carried out by Central Road Research Institute (CRRI) has reported that annual traffic growth vary in the range of 2%–4% in central zone, 5%–7% in the intermediate zone and 8%-9% in Bangalore. The project road falls in intermediate zone with traffic growth varying between 5% and 7%, which is constituted by Two wheelers, autos, cars and small proportion of commercial vehicles. Since, only passenger car movement is expected on main road of PRR from these layouts, traffic growths will be much lesser than the one applicable for intermediate zone. This has been considered in traffic growth estimates. Considering this, following growth factors are adopted as given in Table 2-32.

Table 2-32: Traffic Growth, Generated Traffic

Generated	Car	LCV	Mini Bus	Bus	2AT	3AT	MAV
2019-2023	4.50%	4.00%	3.00%	4.00%	2.00%	2.00%	2.00%
2024-2028	4.95%	4.20%	3.15%	4.20%	2.00%	2.00%	2.00%
2029-2033	4.70%	3.78%	2.84%	3.78%	2.00%	2.00%	2.00%
2033-2038	4.23%	3.40%	2.55%	3.40%	2.00%	2.00%	2.00%

2044-2048	3.43%	2.76%	2.07%	2.76%	2.00%	2.00%	2.00%
2049-2053	3.09%	2.48%	1.86%	2.48%	2.00%	2.00%	2.00%

2.12 Capacity Analysis

Capacity of road project road sections are estimated in accordance with Indian Highway Capacity Manual (Indo-HCM), December 2017. Lane capacity for main road of PRR is worked out based on the guidelines given in Chapter 4: Interurban and Urban Expressways. Lane capacities for each of the sections are worked out as follows:

- Stream Equivalency Factor (SEF, S_e) is worked out using equations 4C.6, Section 4C.2 of Annexure 4C.

- Equivalent PCU is computed by multiplying total number of vehicles with SEF for each sub-sections.

- From Traffic volume count survey carried out at various road sections, Peak Hour Factor (PHF) and Direction Distribution Factor (DDF) is estimated. It is assumed that the PHF and DDF on the existing road will prevail on PRR also.

- Peak Hour Traffic is computed by multiplying Daily Traffic (PCU) with PHF and DDF. Peak hour traffic is computed separately for diverted and generated traffic separately. The summary of Peak Hour Traffic adopted for capacity analysis is given in Table 2-33.

Table 2-33: Summary of Peak Hour Traffic

Capacity of three homogenous sections are worked out considering capacity per lane as 2300 PCU / Hour in accordance with Table 4.2, Section 4.5.2 of Indo-HCM Manual. This value corresponds to 8 lane divided urban road. Bangalore Metro Rail Corporation Limited (BMRCL) is implementing metro connecting various parts of the city. As part of phasing plan, existing Outer Ring Road (from Central Silk Board to Hebbal), Electronic city on south, Whitefield on West and Bengaluru International Airport on north will be connected. This will reduce traffic on road with shift in ridership from personalized transport to Mass transport facility. Hence, in the capacity analysis, reduction in vehicles on account of Metro is considered 2024 onwards.

Summary of projected traffic volume and no of travel lanes required for 3 homogenous sections are computed and given in Table 2-34.

Table 2-34: Capacity Analysis

The main road sections (1,2, and 3) of PRR will reach its capacity in year 2045, 2043 and 2049 respectively. This is based on the assumptions and considerations made in traffic growth estimate as on date. As discussed during 4th meeting of TAC, the traffic growth for the project shall be computed at regular time period after project implementation and traffic projections, lane requirements and V/c ratio to be assessed.

-----XXXXX-----

SECTION – 3
DESIGN STANDARDS

3 DESIGN STANDARDS

3.1 Introduction

Peripheral Ring Road is an access controlled facility for main road traffic movement intended to provide efficient, speedy movement of relatively high volumes of heavy motorized traffic with higher degree of safety, comfort and economy. Alignment characteristics and cross section elements and facilities should be such that the facility at all point of time is amenable for widening / improvement with provisions to accommodate other transportation systems as and when required depending on the traffic growth and projections.

The proposed PRR will be located at a radial distance of 17–25 Km from city centre. Hence, the roadway facilities proposed and design parameters finalized should take into account fast moving traffic like trucks, multi axle vehicles and long distance passenger cars on main road and at the same time slow moving vehicles like T/w, auto and non motorised traffic and bus services on service roads. Hence, the choice of design parameters depends on the traffic mix proposed across the cross section (main road and service road).

3.2 Design Philosophy

The design philosophy adopted for development of project road is from the guidelines prescribed in various standards of Indian Road Congress. While it is important to provide higher standards of design at initial stage, it is equally important that such proposals are rendered cost effective. Hence, the planning parameters of design are developed under following standards:

- The desirable standards which could be adopted as a rule
- The minimum standards, which could be accepted for difficult stretches where application of the desirable standards, would lead to exorbitant costs due to excessive land acquisitions.

Even though the main road of PRR is proposed to be access controlled facility for fast moving commercial and passenger car traffic, the design provisions are not taken from IRC:SP:99-2013 "Manual of Specifications and Standards for Expressways" or from IRC Design Manual applicable for National Highways as many roadway parameters like Right of Way, C/w dimensions, Design Speed and the mix of traffic are different. The design speed for the project is governed by the land already earmarked for the project road by Bangalore Development Authority and various other requirements like space for future transportation system, space for ITS equipment, service road, utility corridor etc. are to be retro-fit within the available ROW. In this regard the consultant had detailed discussions with BDA, DULT

and TAC and finally adopted IRC: 86-2018 "Geometric Design Standards for Urban Roads and Streets" as the primary codal reference for the alignment.

3.3 Project Features

Peripheral Ring road is proposed to access controlled facility for main road traffic which comprises of passenger cars, trucks, light commercial vehicles and buses. Since the project road passes through urban / semi urban area around Bangalore city, considerable local traffic is also expected in addition to generated traffic. Local traffic, which essentially comprises of T/w, autos, BMTC bus services, tractors, bicycles use service roads which are proposed on either side of main road. Due the development on both sides of road, crossing facilities for local users will also be required – both for passenger vehicles and for pedestrians. Hence, it is necessary to provide access / entry / exit points at suitable locations where traffic movement is expected. For the project, entry and exit points are provided at major radial road networks in the form of Underpasses / Grade Separators.

3.4 Road Design

3.4.1 Terrain Classification

The general slope of the country classifies the terrain across the area. The terrain is an important parameter governing the geometric standards and the criteria given in Table 3-1 are used in classifying terrain under these categories. While classifying a terrain, short isolated stretches of varying terrain are not taken into consideration. The proposed road is generally in plan terrain for most length.

Table 3-1: Terrain Classification Recommended by IRC

Terrain Classification	Cross slope of the country	
Plain	0 – 10	More than 1 in 10
Rolling	10 –25	1 in 10 to 1 in 4
Mountainous	25 –60	1 in 4 to 1 in 1.67
Steep	>60	Less than 1 in 1.67

3.4.2 Design Speed

Design speed is the basic criterion for determining all geometric features of horizontal and vertical alignments. The design speeds for various terrain conditions given in Clause 3.2 of

IRC:86 for various road classification and terrain condition. The details are given in Table 3-2. Design speed is mainly be used to determine the following parameters:

- Horizontal curve and super elevation parameters
- Length of Vertical Curves / K factors
- Geometric layout of the interchanges (specifically layout of the accesses, including length of taper and merging areas, and weaving zones)
- Layout and characteristics of signs

Table 3-2: Design Speeds to be adopted for Different Terrain

Class of Urban Road	Type of Terrain		
	Plain	Rolling	Mountainous & Steep
Urban Expressway	80	70	60
Arterial Road	60	50	40
Sub Arterial Road	60	50	40
Collector Street	40	40	30
Local Street	30	30	30

The project corridor is finalized by BDA considering availability of land free of major encumbrances. Since horizontal geometry has to be fit within the project corridor already acquired by BDA, design speed of 60 Kmph is considered for main road design. It is emphasized here that the horizontal alignment for the PRR project is based on the right of way marked by BDA and the horizontal alignment (which is exactly center of 100m ROW) is designed with geometry which caters for speed of more than 60 Kmph. Service road is proposed for 30 Kmph considering local traffic which includes slow moving traffic and non motorised traffic.

3.5 Typical Cross Section

The project corridor width is approved by the Government vide No. 214 dated 03/10/2019. Accordingly, the project road will be with 100m Right of Way comprising of main road, service road, road side drains, footpath etc., Typical cross section for the project consists of the following cross section elements:

- Alignment will be concentric w.r.t ROW with horizontal geometric design.

- Main Road, 14m wide with 0.5m edge strip and space for gantry of 0.75m on central median side, 1.5m paved shoulder and 0.75m space for gantry on separator median (service road) side
- Service Road, 10.5m wide, with 0.25m kerb shy distance each next to main road separated by separator drain.
- 2m cycle track, 2m wide footpath, 1m exclusive space for U/G cables and 2m wide space for other utilities beyond service road towards ROW.
- 1m wide drain next to service road
- 5m green space at end of ROW on both sides.
- Central median of 13m.

Typical cross sections are developed for the project road considering the following:

- Sections with normal embankment with flat ground across the section
- Section at locations of underpass approaches
- Sections at locations of flyover approaches
- Sections at locations of ROB / RUB approaches
- Sections requiring earth retaining structures between main road and service roads

Typical cross sections adopted for the project is given from Figure 3-1 to Figure 3-15.

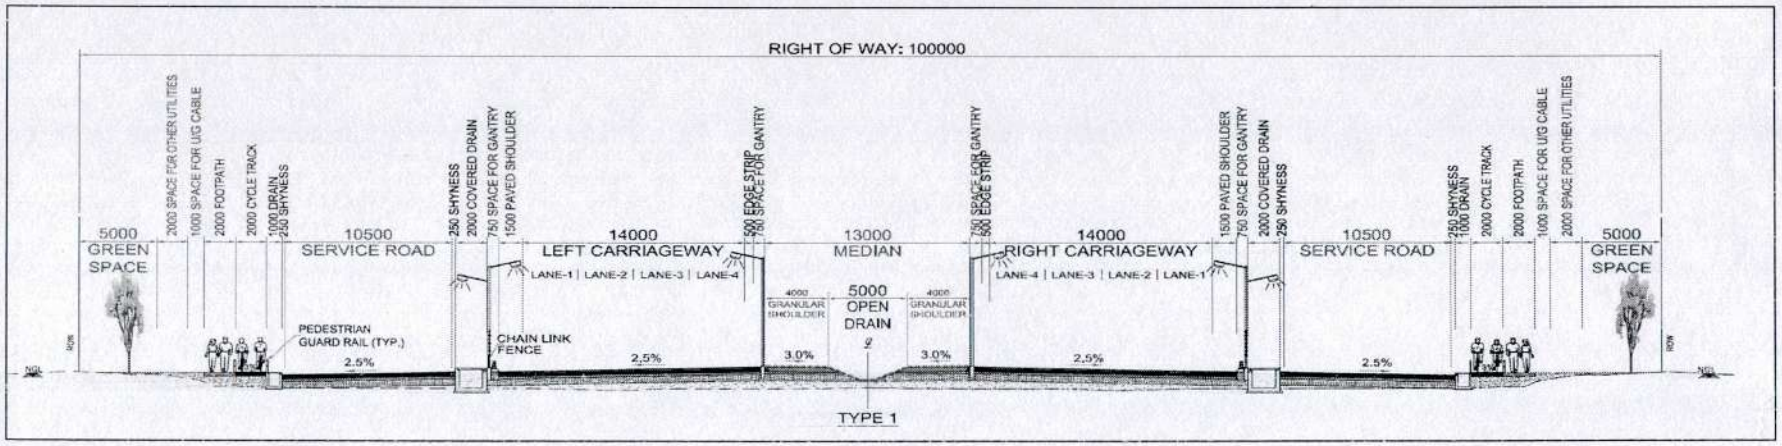

Figure 3-1: Typical Cross Section - at grade

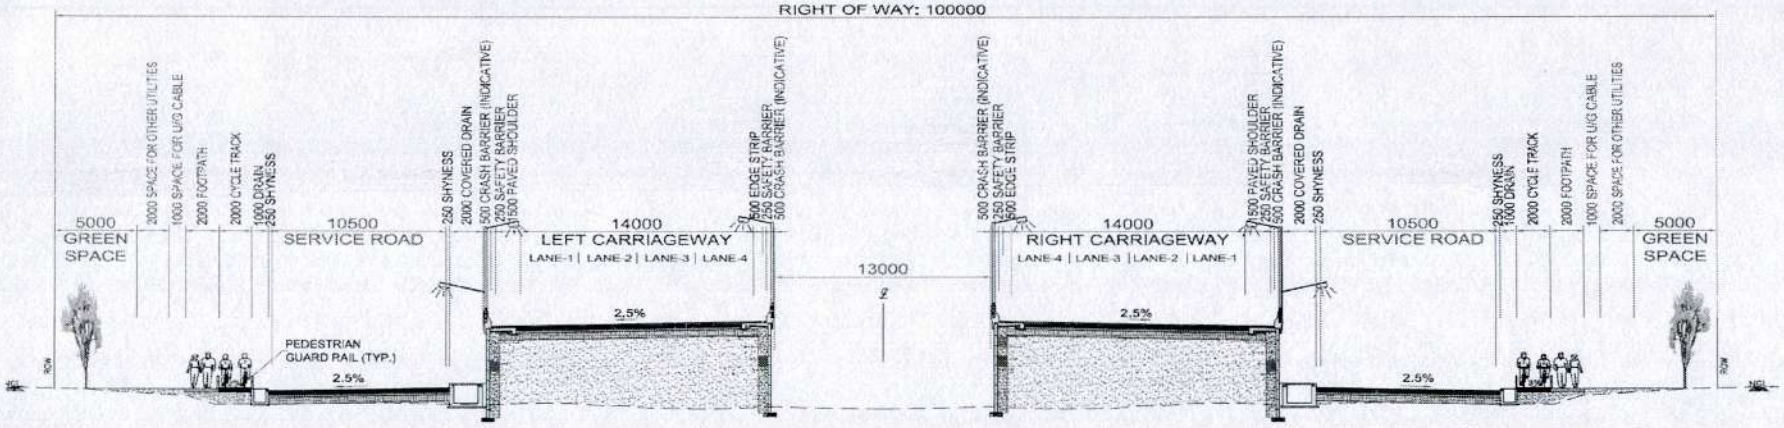

Figure 3-2: Typical Cross Section at VUP and PUP approaches

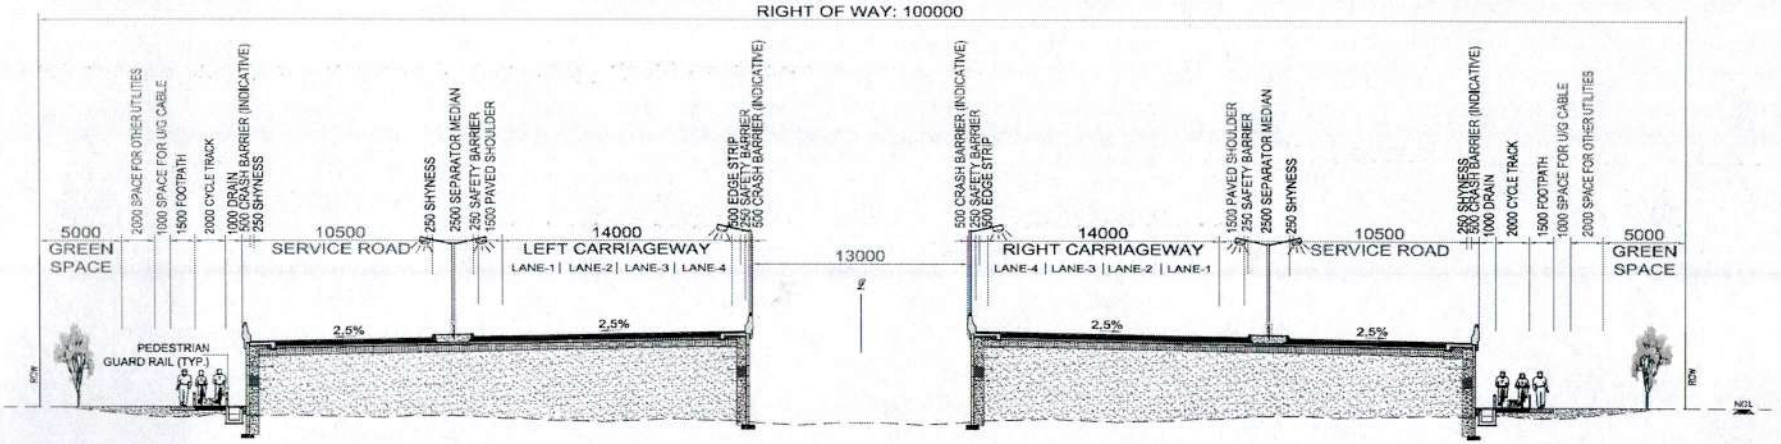

Figure 3-3: Typical Cross Section at ROB approaches

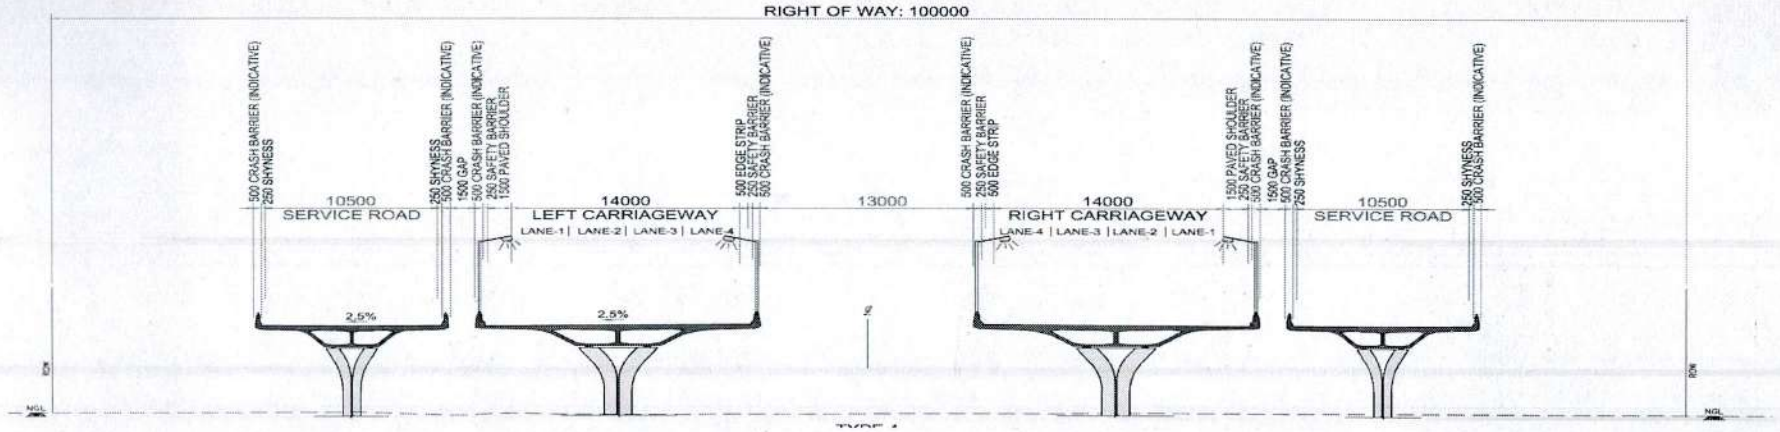

Figure 3-4: Typical Cross Section at ROB crossing portion

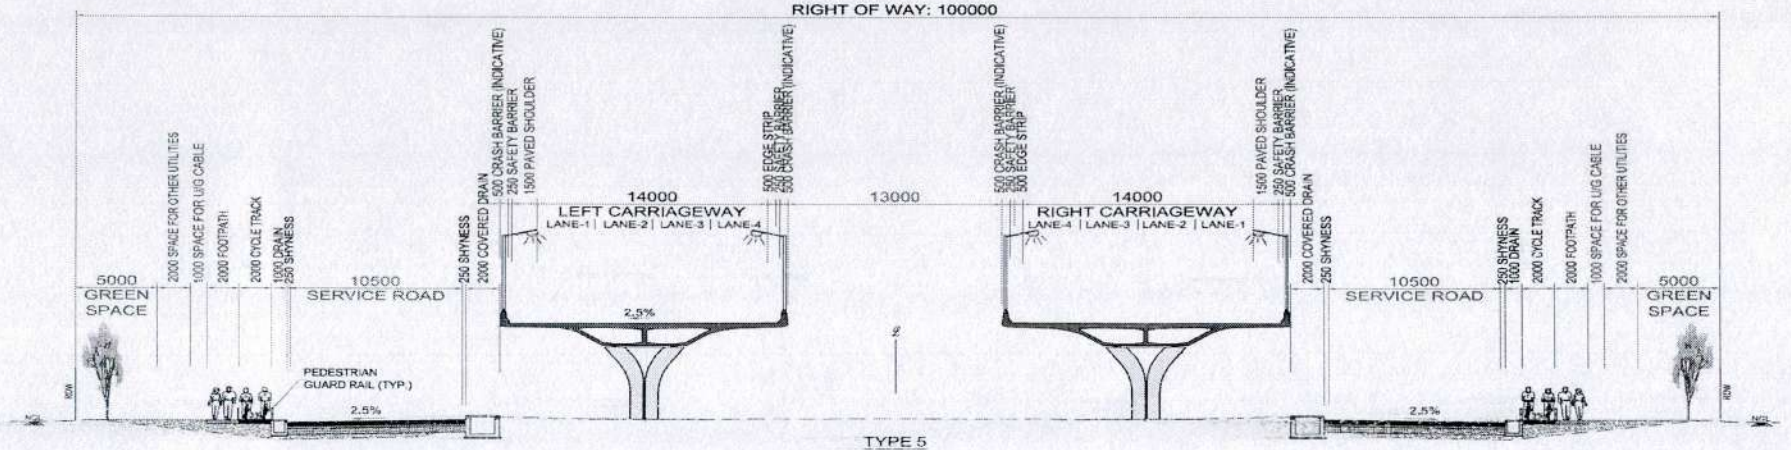

Figure 3-5: Typical Cross Section at flyover portion

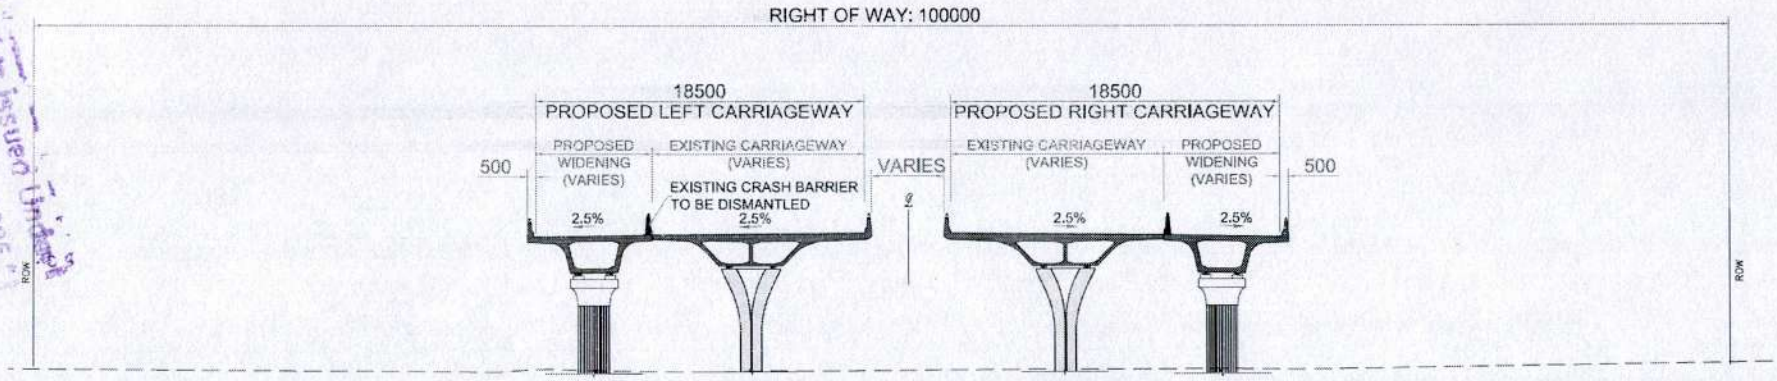

Figure 3-14: Typical Cross Section – At Tumkur Road & Hosur Road Flyover Portion

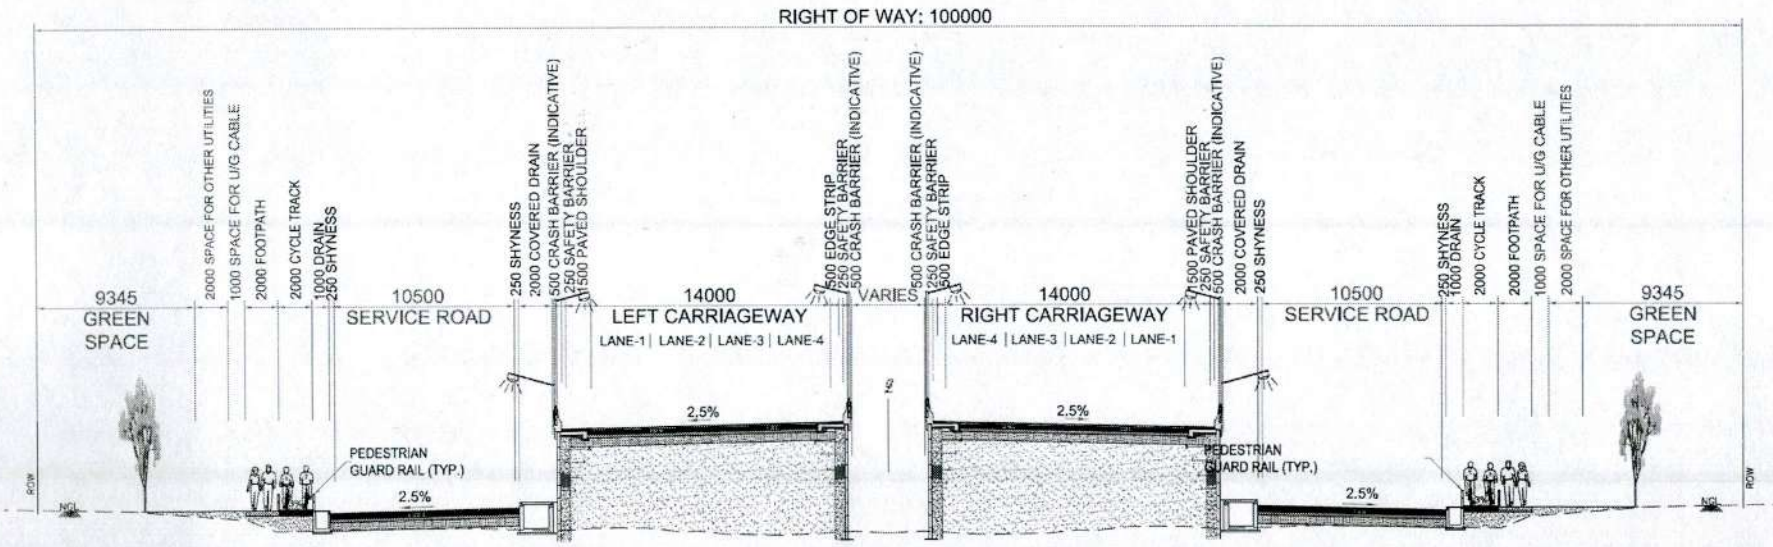

Figure 3-15: Typical Cross Section – At Tumkur Road Flyover Approach Location

3.5.1 Cross Sectional Elements

The cross section elements for the project is governed by roadway proposed to be acquired by BDA, type of facility proposed to be given for fast moving traffic and slow moving traffic, buffer space for other mass transportation facilities in future, space for pedestrian walkway and utilities. Cross Section elements proposed for the project is given in following sections.

3.5.2 Road Land width

Road land width also termed as right-of-way is the width of land acquired for road construction. The total land acquisition for PRR is 100m, except at locations of toll plaza and interchanges where more land width is required.

3.5.3 Lane width

The lane width of single lane is considered as 3.5m as per clause 5.4 of IRC:86. Hence, the total width of four lane configuration will be 14m, each traffic direction. This excludes shy distance.

Width of service road is proposed as 10.5m as per Table 5, clause 6.2.4 of IRC: 86-1983.

3.5.4 Width of the Shoulder

Paved shoulder of 1.5m in width next to main c/w as per IRC: 86-1983 guidelines.

3.5.5 Median width

The width of central median is proposed to be 13m separating traffic directions. The width of 13m is adopted considering space requirements for other mass transportation facilities like Metro / Mono / BRTS in future.

3.5.6 Camber

Camber of 2.5% is proposed for main road and service road. Camber of main road and service road is oriented towards drain. This is as per Clause 6.1 of IRC:86.

3.5.7 Side Slopes

As the ROW is restricted, there is very little chance of providing natural slope. As a result of this retaining wall is provided where ever required.

3.6 Horizontal Alignment

3.6.1 Horizontal Curve

Horizontal curve consists of circular portion flanked by spiral transition at both ends. Design speed, super elevation and coefficient of side friction govern the design of circular curves. The provision of transition curves enhances the safety of the road users, as it will allow a smooth change in the rate of change of superelevation, and also reduces the centrifugal forces on the vehicle. Length of transition curve is determined on the basis of rate of change of centrifugal acceleration or the rate of change of super elevation, whichever is higher. Design of horizontal curves is based on Clause 8.1 of IRC:86 and IRC :38. Minimum radius of curve corresponding to design speed of 60 Kmph and limiting superelevation to 4% will be 150m as per Clause 8.2.1 of IRC:86.

Minimum length of horizontal curve is derived from the equation:

$$R = \frac{V^2}{127(e+f)}$$

Where

R is the minimum radius of curve, m

V is the Design Speed, Kmph

'e' is Superelevation

f' is the coefficient of side friction between vehicle tyres and pavement (taken as 0.15)

Minimum length of horizontal curve required to be provided is 150m.

3.6.2 Transition Curve

Transition curves are computed as per guidelines given in Clause 8.5 of IRC:86. Transition curve has a radius which decreases from infinity at the tangent point to a designated radius of the circular curve. Transition curves on highways are provided to bring about gradual change in carriageway rotation from normal camber of 2.5% to the value equal to that of super elevation. This will be required to counteract centrifugal force a vehicle will develop during negotiating a horizontal curve. Transition curve adopted in the design is taken as highest of the following values (clause 7.3, IRC: 38-1988)

- Rate of change of centrifugal acceleration

$$L_s = \frac{0.0215V^2}{CR} \quad \text{and C} = \frac{80}{75+V}$$

Where

Ls is length of transition curve, m

V is the Design Speed, Kmph

R is the Radius of Curve, m

- Rate of change of super elevation (1 in 150), Ls = C/w x e x 150

Where

Ls is length of transition curve, m

e is the super elevation provided

C/w is carriageway width, m

- Empherical formula as per IRC

$L_s = \frac{2.7V^2}{R}$ or $L_s = \frac{1.0\,V^2}{R}$

Considering above conditions, the minimum length of transition curve required will be 130m for Minimum Design Speed and limit the superelevation to 4%.

3.6.3 Superelevation

Superelevation is generally considered to counteract only a fixed percentage of the centrifugal force developed on horizontal curves, so that the slow moving traffic will be aided through the curve. For the project, maximum super elevation adopted is 4% as per clause 8.2.1 of IRC:86-1983. Superelevation is calculated by the following formula.

$$e = \frac{V^2}{225R}$$

Where

'e' is Superelevation

'V' is the design speed in Km/h

'R' is the radius in meters

Radius more than or equal to 640 m will not require rotation of carriageway for counteracting centrifugal force.

Since paved shoulder is provided as part of main road and slow moving traffic are not allowed, extra widening on curves are not provided. Also, the minimum curve radius provided in the design is 400m, whereas extra widening is required if the curve radius is less than or equal to 300m as per Clause 8.6 of IRC:86.

3.7 Vertical Alignment

The guideline given in Clause 9.1 of IRC:86 in conjunction with IRC: SP: 23-1983 will be followed for the design of vertical alignment.

3.7.1 Gradients

The gradients adopted in the design are as per guidelines given in clause 9 of IRC:86. The allowable difference in grade where no vertical curve is required is 0.8 for design speed of 60 Kmph. The minimum length of vertical curve required for summit and valley curve will be 40m. The maximum gradient adopted in vertical design is restricted to 4.0%.

3.7.2 Combination of Horizontal and Vertical Curves

Where the vertical and horizontal curves cannot be separated, sufficient care has been taken to contain the vertical curves within, and where it was not possible, they were kept outside the horizontal curve. Horizontal alignment and vertical profile are made as flat as possible at intersections, where sight distance is an important design aspect.

3.8 Drainage

Following drainage facilities are made in the design:

- Open drain in central median
- Separator drains between main road and service road, with cross fall towards drain.
- Drain under next to service road under footpath.

Drainage provisions will be in accordance with IRC: SP: 50 guidelines for the project. The sizings of the drain, including the inverts are dependent on hydraulic and hydrological particulars.

3.9 Other Cross Section Elements

Following are the other provisions made in the cross section for the project. The provisions listed below are discussed with BDA and TAC on various occasions and finalised.

3.9.1 Cycle Track

Cycle track with width of 2m is proposed next to service road on ROW side. Cycle track will be provided with paver block pavement.

3.9.2 Footpath

Footpath will be provided next to cycle track. Width of footpath will be 2m. In order to differentiate cycle track from footpath, 50mm offset will be proposed between them. In addition, the colour of the paving blocks of footpath and cycle track will be different.

3.9.3 Utility Space

Space for utilities next to footpath will be proposed. The utility space will consist of 1m corridor for U/G cable and 2m for other utilities.

3.9.4 Green Space

5m wide green strip will be provided at end of Right of Way.

3.10 Facilities Proposed

Following are the facilities proposed as part of the project.

- Grade Separators, Flyovers at Major intersections
- Vehicular Underpasses at other road crossings
- Toll Plazas at entry / exit points (grade separators & Flyover locations)
- Space provision for Bus Stop / Bus Shelter on service road
- Illumination

3.11 Traffic Safety Appurtenances

Following are the road safety / appurtenances proposed for the project:

- Traffic Road Signs
- Pavement Marking
- Raised Pavement Markers
- Object Marking
- Crash Barrier – Metal Beam / New Jersey
- Pedestrian Guard Rail
- Embankment protection works like stone pitching / turfing

3.12 General Design Basis – Structures

The project road comprises of various structures like box `culverts, minor bridges, flyovers, underpasses and railway crossing structures. The design considerations shall be in accordance with applicable IRC codes of practices. General guidelines governing the designs are given in following sections. At some of the structure locations, PRR project road is above the ground and at some locations below the ground. At some other locations, PRR

will be at grade level and the cross road will be above or below the existing road. The structures shall be designed for minimum 100 years design life.

3.12.1 Super-Structure type

Superstructure type for proposed bridge, underpass, ROB and flyovers will be with RCC Box type structures, RCC Solid Slab, RCC Voided Slab, RCC T-beam girders, PSC Girders and PSC box girders, Steel composite girders and Boq String girders. The type if superstructure depends on the span and type of structure.

3.12.2 Sub-Structure

Sub structure comprises of solid RCC piers which will be positioned such a way that the natural stream of flow is not blocked and therefore will not effect velocity of flow. Circular/Square/Rectangular/wall shaped piers shall be reviewed for adopting after considering the aesthetics and economy. Solid wall type abutments shall be provided only in water crossing bridges and at other land structures, normal pier will be proposed with RE wall behind to retain the earth. Abutments shall be provided with Approach slabs as per MORT&H details.

3.12.3 Foundation

Foundations will be with shallow type open foundation for Minor structures and with pile foundation for river bridges, ROBs and flyovers. Necessary soil investigations shall be done. Piles are to be load tested both for initial and routine. All piles shall be tested for integrity.

3.12.4 Design Loads

a) Dead Loads & Super Imposed Dead Loads

Dead load includes self weight of structures and super imposed dead load includes wearing coat, crash barriers, median etc. The weight of wearing coat shall be considered as 200 kg/Sq.m and the weight of crash barrier will be 1 T/m in design.

b) Live Loads

Each four lanes of the structure shall be designed for two lanes of Class A or single lane of Class 70 R loading whichever produces the critical effect. The position of live loads in transverse direction shall be as per Cl 204.1 and Table 6 of IRC: 6. The live load shall be placed in longitudinal direction in such a way that it produces maximum design forces in bearings, sub structure and foundation.

c) Wind forces

Wind forces shall be considered as per Clause 209 of IRC: 6.

d) Seismic Force

The structure shall be designed for appropriate seismic forces as per Flyover shall be designed for appropriate seismic forces as per the provisions of IRC: 6.

The weight of soil likely to be resting on top of the foundation above the general ground level shall be taken into account while computing the seismic forces.

e) Earth Pressure

(i) The soil properties for embankment shall be in accordance with MORT&H specification. The properties of embankment like Dry density of soil 1.85 T/cum, Saturated density 2.00 T/Cum: ø= 30 degree & C=0 shall be considered for design purpose.

(ii) Saturated density of the backfill (minimum 2T/Cum) shall be considered for calculating earth pressure.

(iii) For the soil below water table, submerged density is to be considered in earth pressure calculation. Hydrostatic pressure shall be considered in addition.

(iv) For box type closed structure, earth pressure at rest is to be considered in the analysis.

f) Temperature Range

(i) For design of structure to account for temperature in formula movement (DL) = ΔLt, the value of "t" shall be 25 degree centigrade

Δ = Coefficient of expansion or contraction

L = Length of the member

(DL) = Expansion / contraction due to temperature variation is appropriate units.

(ii) The superstructure shall also be designed for effects of distribution of temperature across the deck depth as per IRC: 6.

3.12.5 Structure Configuration

All the structures for the flyover carriageway shall be designed 16.5m 4 lanes) outer to outer width. The salient structural component of the proposed elevated corridor is given in **Table 3-3**.

Table 3-3 Structural Details of the Flyover

Sl.No.	Span Length	Type of Super Structure	Type of Substructure	Type of Foundation
1	30m to 60m (For Flyover)	Precast twin cell Box Girder Segmental type Construction	Authentically designed rectangular pier and curved in shape after certain height	Pile Socketed into rock

3.12.6 Vertical Clearance

As per IRC: 54 requirements, minimum vertical clearance to be provided between top of surface level load and soffit of girder / slab is 5500 mm in urban areas. The clearances in railway crossing will be 6525 mm above rail level.

3.12.7 Approach Ramp

It is proposed to adopt "Reinforced Earth" type retaining structure for the approach ramp up to 6m height above FGL. The reinforced earth facia wall made of precast concrete panels offers great scope for a variety of aesthetic treatments in the form of panel shapes and colour. Apart from aesthetics, it improves the speed of construction. For heights more than 6m, RCC vertical cantilever type wall will be considered. The wall will be with solid section or with counterforts depends on the heights.

3.12.8 Substructure

(i) RCC solid piers shall be generally as indicated in the drawing.

(ii) Scope for accessibility for inspection of bearings and arrangement for lifting of the superstructure for future replacement of bearings shall be provided for in the design of substructure and superstructure. The positions of flat jacks shall be distinctly marked on the drawing.

3.12.9 Superstructure

a) Deck Slabs

- The minimum thickness of deck slab thickness shall be 200 mm

b) Box Girders

(i) Minimum Web thickness for RCC girders = 250 mm

(ii) Minimum Web thickness for PSC girder of cables as per IRC 112. = depends on type and diameter

However minimum thickness shall also satisfy the provisions of IRC 112.

(iii) The cross diaphragms shall be minimum one number at each support and at ends of cantilever, if any. In addition, at abrupt change in soffit geometry, stiffening frame or diaphragm shall be provided to cater for forces arising out of change in direction.

(iv) Minimum thickness of diaphragms shall be either the thickness of the web at the location or shall be 500 mm from design whichever is greater.

(v) Detailing of structure shall be as per specifications by IRC / MORT&H. Wherever indirect supporting of the structures is adopted, the junction shall be provided with additional reinforcement as prescribed by standards / codes at the junction.

c) PSC Precast girders / Steel composite girders / Bow string girders

The superstructure with PSC girders shall be analysed with two dimensional grillage analysis.

The result of analysis will be considered for the design of main longitudinal girders and diaphragms. The deck slab shall be analysed as a continuous slab supported on longitudinal girder.

d) PSC Precast girders / Steel composite girders / Bow string girders

i) Analysis of structures shall be based on two/three dimensional grillage / three dimensional finite element method of analysis. For straight spans, grillage method of analysis may be adopted and for curved spans, analysis shall be based on finite element method of analysis only. Effect of long-term deformation of diaphragm and consequent redistribution of load in the web shall be duly established and provided for.

ii) Soffit of box shall be kept horizontal and cross slope in deck shall be achieved by varying the web height.

iii) Loads and Load combination to be considered for the design of the box shall be as per Clause 5 of IRC 6.

iv) Reinforcement in the slabs and webs due to the transverse moments must be provided in addition to the steel, which is required for shear or torsion in the box as a main girder in longitudinal direction.

v) Minimum un tensioned reinforcement shall be as per IRC 112. Reinforcement required for traverse bending of box as whole, horizontal cable deviations, etc. shall be provided in deck / soffit slab in addition to the steel required for transverse bending.

vi) In shear calculations (for both maximum shear stress calculations & shear capacities calculations), vertical upward component of pre stress should not be considered in designs for sections cracked in flexure. Sections shall be considered cracked or uncracked based on cracking moment at those sections. Section is considered to be cracked when ultimate moment is more than cracking moment at that section and section is considered to be uncracked if cracking moments is more than ultimate moment at that section.

vii) In maximum shear stress calculations, effective depth should be calculated corresponding to C.G. of pre stressing steel.

viii) If simply supported spans are used, deck continuity shall be properly designed and provided shall to the satisfaction of Engineer in charge. The arrangement shall ensure riding comfort without causing an aesthetic infringement. The webs over the supports shall also be made aesthetically continuous.

e) Pre stressing Steel

i) The pre stressing cables to be used shall be made using low relaxation HT strands conforming to BIS: 14268. Pre-stress of steel if not used within 3 months manufacture, the same shall be tested again before use.

ii) All pre stressed members shall have spare cables laid to the profiles approved by the Engineer, Employer/ Employer's Representative. The number of spare cables shall be at least 5% of the cables required as per design, subject to a minimum of one cable per girder/web. These cables shall be permitted to be removed fully or partly after the final stage of pre stressing, if they are not required and holes grouted.

iii) The maximum permissible jacking force shall be as per clause 7.9.2 of IRC:112

a) Only approved rigid HDPE sheathing shall be used
b) Temporary pre stressing shall be done using Bars of approved system
c) Curved tendons in curved spans shall be detailed as per clause 7.10 of IRC:112
d) Future pre stressing provisions shall be made wherever possible.

3.13 Material

The material requirement is briefed in the following sections.

(i) Minimum Grade of Concrete:

a) Pile - M 35 Grade
b) Pile cap - M35 Grade
c) Pier - M35 Grade
d) PSC Super Structure - M45 Grade
e) RCC Super Structure - M35 Grade
f) PCC - M15 Grade
g) Crash Barrier - M40
h) Approach Slab - M30

(ii) Reinforcement

a) Fe 500 conforming to IS:1786.

(iii) Condition of Exposure - Moderate

3.14 Bearings below Superstructure

a) Only POT – PTFE bearings manufactured by MORT&H approved manufacturer is acceptable for long span superstructure.
b) The bearings shall be easily accessible for inspection / maintenance.
c) Wherever bearings have to resist uplift force, it shall be of spherical knuckle type and shall be designed as per AASHTO code (Section 14) unless specified otherwise.
d) Scope for lifting the superstructure for future replacement of bearings shall be provided for in the design of bearing. The scheme of lifting shall be indicated on the drawing to be submitted along with the technical bid.
    i) The POT bearings shall conform to the requirements of the MORT&H specifications/IRC 83 Part III. The pots shall be of cast steel of approved grade unless specified otherwise. The minimum thickness of the stainless steel sliding plate shall be 3 mm.
    ii) The dimensions of top plate of bearing shall be such that the contact surface of superstructure projects beyond the edge of bearing plate by a minimum distance of 100 mm at any location.
    iii) All the bearings need to be tested for the acceptance criteria as per the provision of MORTH/ IRC specifications.
    iv) Neoprene elastomeric bearings shall be consideredfor small spans.

3.15 Expansion Joints

Strip seal / Modular type expansion joint conforming to section Clause 2607 of MORT&H Specifications shall only be allowed. Calculations for the adequacy of the type of expansion extent, which is selected by the tenderer, shall be submitted in the Technical bid along with name of manufacturer and their technical details. Expansion joints shall be provided with

loop anchors. During installation of these joints, manufacturer's engineer shall be required to supervise the same including thermal presetting, if required. The expansion joint locations shall be carefully treated and harmonized to ensure aesthetics.

3.16 Pre cast Segmental Construction

Following aspects shall be taken into account while designing and constructing using this technique.

a) All segments in a span shall be of precast only and no stitch elements shall be permitted.
b) All the segments shall be long line match-cast.
c) Stressing of cables shall be done from one end only.
d) The shear keys at the face of segments shall be as under:
    i) On each web single key or multiple keys shall be provided as per IRC codal provisions. The decision of Employer/Employer's Representative in respect of numbers of shear keys and areas shall be final.
    ii) On the top and bottom slabs keys shall be provided to maintain alignment and level.
    iii) Total area of shear key provided shall not be less than 20 % of area of cross section of box.
e) Formwork shall be robust and the foundations of the casting and stacking yard shall be designed to safely support all applied loads without undesired deformations or settlements.
f) In order to achieve smooth profile of pre stressing cables and to prevent entry of cement slurry at the joints of matching segments, PVC pipe shall be inserted through the cable duct of both the segments (i.e., matching segment and segment being cast) at the time of concreting.
g) The work shall be executed by specially experienced team of prestressing professionals.
h) Bond breaking agents shall be used while casting the segments so that the segments can be easily separated after casting. Scheme for precasting of segments shall be got approved by the Engineer.
i) The joints between adjacent segments shall be treated with appropriate epoxy formulation to facilitate erection and to fill cavities if any. While applying epoxy, care shall be taken to see that the epoxy does not block the openings of the cable ducts.
j) Epoxy shall be applied on the interface of both the segments and the joint subjected to a minimum pressure of 3.0 Kg/Sq cm. This may be achieved by temporary prestress or

any other approved means. Permanent cables shall then be introduced in the ducts and after prestressing the required number of cables in the specified sequence the temporary prestress may be released.

k) The method of erection of segments shall be such that the desired geometric profile of the Flyover deck is obtained.

l) The segments shall be checked for stresses during handling and erection and necessary calculations submitted for Engineer's approval.

m) Calculation for segment casting dimensions shall be submitted for Engineer's approval taking into account the effect of creep and shrinkage.

n) Only overhead launching without bottom support is acceptable.

o) Reference may be made to the document "Guides to good practice Recommendations for segmental construction in Prestressed Concrete" published by FIB and state of the art report on materials and systems for external prestressing.

3.17 Retaining Walls

Typical cross for the project warrants containing embankment spill within 100 m ROW. This necessitates provision of retaining wall between main road and service road and / or at end of service road. Retaining wall will also be required at approaches of underpass / flyovers.

3.18 Shifting of Utilities

Shifting of utilities shall be taken up prior to the commencement of construction of retaining wall. Prior to the commencement, the contractor will have to co-ordinate the shifting with the respective agency representatives. The same shall be carried out under their direct supervision with minimal disruption of the services.

3.19 Design of Structures

The design of entire structures for the project shall be as per IRC:112. The following are to be considered in the design:

- Load combinations as per IRC:6
- The design of Pier for slenderness effet due to long column behavior is to be as per IRC:112.
- The crack width limitations and deflections shall be as per the provisions in IRC:112.
- The detailing of reinforcement and pre stress cables etc., shall be as per IRC:112 codal provisions.

- The structural members are to be designed for ULS and SLS condition for the stress in concrete and steel within permissible limits.

3.20 Drainage Arrangement

For the provision of adequate drainage of rain water from the viaduct portion, drainage spouts with 50m dia stainless steel drain pipes shall be provided at an interval of 1.5 m c/c on either sides of carriageway in a staggered manner. The water on the earth filled portion shall be allowed to flow over the surface till the cross drain provided at the foot of the grade separator on either side of grade separator and then this water shall be taken to the road side drains through NP3 type RCC pipe of suitable size which shall be laid 600 mm below the road formation level over PCC bedding. The drainage arrangements shall be provided in the landscaping areas as well and then this water shall also be taken to the road side drains through NP3 type RCC pipe of suitable size which shall be laid 600 mm below the road formation level over PCC bedding.

3.21 Surveys and Investigations

The consultant has carried out following surveys and investigations for the project. These are briefly given in following sections.

3.21.1 Traffic Surveys

Traffic surveys were carried out on all major road networks nearer to proposed PRR alignment. Traffic surveys included 3 / 7 days volume counts, Origin Destination surveys and Registration Plate surveys. Details are in given in Section 2 of this report.

3.21.2 Axle Load surveys

Axle load surveys were carried out on existing National Highways nearer to proposed PRR alignment. The survey comprised of measurement of axle loads of commercial vehicles like LCV, 2 axle trucks, 3 axle trucks, multi axle vehicles and buses. Vehicle Damage Factor for various categories of vehicles were computed as per IRC:37. Summary of Vehicle Damage Factor at various locations are given in Pavement design section.

SECTION – 4
PAVEMENT DESIGN

4 PAVEMENT DESIGN

4.1 General

This section describes the design considerations and methodologies adopted for pavement design. For the project, following pavement types are used. They are

- Flexible pavement for main road
- Flexible pavement for service road
- Rigid Pavement for Toll Plaza & its approaches.

The pavement type is finanlised based on detailed discussion with TAC meetings. TAC suggested to adopted flexible pavement instead of rigid pavement earlier proposed.

4.2 Design of Flexible Pavement

Pavement designs for new construction of flexible pavement for main road are in accordance with the latest guidelines given in IRC: 37-2018. Design steps for flexible pavement are given in following sections.

4.2.1 Design Life

Design life of flexible pavement is taken as 20 years as per clause 4.3.1, IRC-37:2018.

4.2.2 Lane Distribution Factor

Lane distribution factor of 0.45 is considered for 4 lane dual carriageway, in accordance with the clause 4.5.1.5, iv IRC: 37-2018 for dual four lane carriageway roads.

4.2.3 Subgrade Strength

Pavement crust is computed for an effective soil CBR value of 10%. At locations, where CBR value is less than 10%, it is proposed to remove existing soil and replace with borrow soil of CBR of greater than 10% and compact to 97% of proctor density.

4.2.4 Traffic Loading

Traffic considered in computation of pavement design is obtained from Annual Average Daily Traffic (AADT) for three homogenous sections separately with corresponding growth rates. Details are given in Table 4-1.

Table 4-1: Design Traffic for Pavement Design

Traffic Loading, PCU			
Year	Section-1	Section-2	Section-3
2019	20559	27740	27875
2022	24237	32378	33002
2027	31554	41502	43362
2032	40392	52445	56220
2037	51057	65655	72105
2042	64065	81794	91614

4.2.5 Vehicle Damage Factor

The consultant had carried out axle load survey in 2019 on existing roads intersecting PRR. Vehicle Damage Factors for commercial vehicles are computed and is presented in Table 4-2.

Table 4-2: Vehicle Damage Factors adopted

Vehicles	Section-1	Section-2	Section-3
LCV	0.904	0.991	0.798
Mini Bus	0.899	0.951	0.962
Bus	0.899	0.951	0.962
2 Axle Truck	3.381	2.560	3.204
3 Axle Truck	4.435	5.181	5.562
MAV	10.895	10.643	10.808

4.2.6 Design Traffic Loading

Design traffic in terms of equivalent million standard axles (EMSA) is computed for diverted traffic and generated traffic separately in spread sheet using AADT and VDF for three sections separately and details are given in Table 4-3, Table 4-4 and Table 4-5 respectively.

Table 4-3: Estimation of EMSA, Section-1

IRC: 37 2018 provides design catalogue for pavement crust for various combinations of subgrade CBR and Design Loading (MSA). However, the maximum value of MSA is limited to 50 MSA, unlike earlier version of the code which provided for pavement thickness upto 150 MSA. In the present design, Pavement thickness of all Layers will be provided for 20 years design life. Stresses and strains are computed for the pavement crust to check within permissible limits. Adopted Design loading for pavement crust and stress – strain computation is given in Table 4-6.

Table 4-6: Adopted Design Loading, MSA

Design Loading	Sections

15 years	64	84	89
20 years	96	126	133
Design load adopted	100	130	135

Service Road is proposed to be designed for 20 MSA.

4.2.7 Pavement Crust

Flexible pavement with following composition is proposed as given in Table 4-7.

Table 4-7: Proposed Pavement Composition

Pavement Composition, mm	Section-1	Section-2	Section-3	Service Road
Stone Matrix Asphalt (SMA) SMA,mm	50	50	50	40
Dense Bituminous Macadam (DBM),mm	115	130	130	75
Wet Mix Macadam (WMM),mm	250	250	250	250
Granular Sub Base (GSB),mm	200	200	200	200
Total,mm	615	630	630	565
Subgrade, CBR >=8%,mm	500	500	500	500

4.2.8 Design Check

Typical calculation for stress and strains are computed for section-1. The selected pavement crust should be checked for stress and strains at critical locations as per clause 3.6.1 of IRC: 37. Pavement should be checked for

- maximum tensile strain at the bottom of the bituminous layer as per Equation 3.4 of IRC: 37-2018 (at 90% reliability level) using formula:

$$N_f = 0.5161 * C * 10^{-04} [1/\varepsilon_t]^{3.89} * [1/M_{Rm}]^{0.854}$$

Where, Nf = Fatigue life in number of standard axles =100 MSA (for section 1)

ϵ_t= Maximum tensile strain at the bottom of the bituminous layer

M_R= Resilient modulus of the bituminous layer =3000Mpa

C= factor to be introduced in fatigue models to take into account the effect of air voids (Va) and volume of bitumen (Vb) , which is given by the following relationships

$$C = 10^M, \quad \text{and} \quad M = 4.84 \left(\frac{Vbe}{Va+Vbe} - 0.69 \right)$$

Va= air voids=3%

Vb= Volume of the bitumen = 13%.

By substituting above values in equation, ϵ_t= 206 Microstrain

- maximum vertical strain at top of subgrade as per Equation 3.2 of IRC: 37-2018 (at 90% reliability level) using the formula:

$$N_R = 1.4100 \times 10^{-08} [1/\varepsilon_v]^{4.5337}$$

N_R = Number of cumulative standard axles = 100 MSA (for section 1)

ϵ_v= Vertical compressive strain at the top of the subgrade

ϵ_v= 319 Microstrain

IITPAVE software is used to compute the stress and strains at critical positions in the pavement and compared with allowable limits for all the three sections. Input parameters for Section 1 is given in Table 4-8 and output result is given in Table 4-9. Table 4-10

Table 4-8: Input for Stress / Strain Computation – Section 1

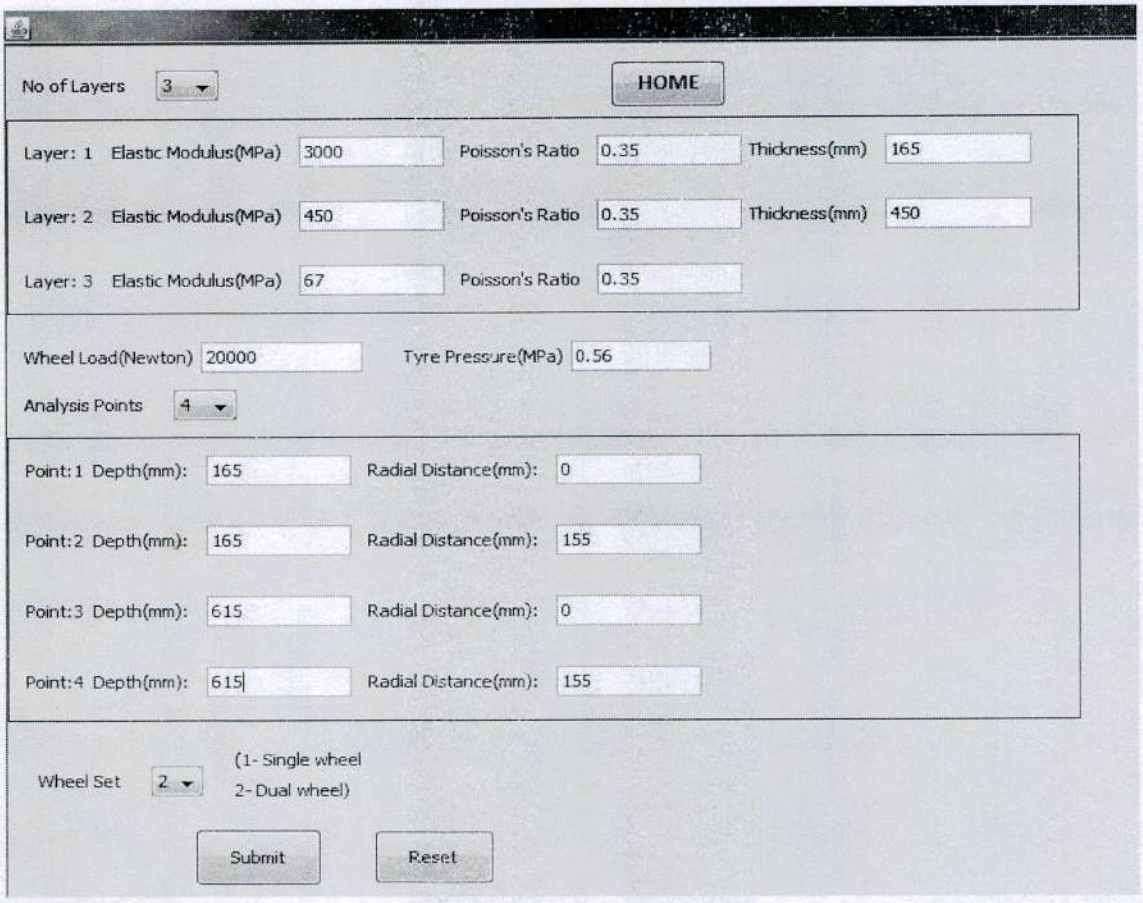

Table 4-9: Results of Stress – Strain Computation – Section 1

Computed strains using IIT -Pave software are less than the Maximum allowable strains, hence the selected pavement composition is safe. The input and output window for the IIT-pave for all sections are attached with this document. The maximum allowable strains for section-2 and section-3 can be worked out as above.

4.3 Cement Concrete Pavement

Rigid pavement is proposed at toll plaza and its approaches. Pavement Design for CC pavement is carried out in accordance with IRC:58-2015 and step-wise procedure is given as follows:

a) The basic design parameters are assumed as given in Table 4-11.

Table 4-11: Parameters used in CC Pavement Design

Sl No	Parameter	Value	Unit	Remarks
1	Design Life	30	Years	
2	Subgrade CBR (Effective)	8	%	Select soil
3	Modulus of Subgrade Reaction	48	Mpa/m	Table 2, IRC:58
4	Thickness of Granular Sub Base	150	mm	
5	Thickness of Dry Lean Concrete	150	mm	
6	Modulus of Subgrade Reaction for DLC	277	Mpa/m	Table 4, IRC:58
7	Modulus of Elasticity of Concrete, E	30000	MPa	Clause 5.8.4.1, IRC:58
8	Poisson's Ratio, μ	0.15		Clause 5.8.4.1, IRC:58

Sl No	Parameter	Value	Unit	Remarks
9	Coefficient of Thermal Expansion, α	$10x10^{-6}$		Clause 5.8.5, IRC:58
10	Unit weight of Concrete, Y	24	Kn/Cum	
11	Compressive strength of concrete, f_{ck}	40	Kn/Cum	
12	Flexural Strength of Concrete (28 days), f_{cr}	4.5	MPa	Clause 5.8.4.1, IRC:58
13	Flexural Strength of Concrete (90 days), f_{cr}	4.95	MPa	Clause 5.8.4.1, IRC:58
14	Max Daily Temperature, Δt	21	°C	Table 1, IRC:58
15	Night Time Temperature, Δt	15.5	°C	Clause 6.9.1, IRC:58
16	Load Transfer Efficiency Factor, β	0.66		Appendix - V

b) The loading spectrums at each of axle load location are compiled into single axle and tandem axle for all commercial vehicles applicable. They are further grouped into various load groups. The higher of the axle loads in terms of the frequency is considered in further analysis for fatigue computation.

c) The modulus of subgrade reaction at subgrade for effective subgrade CBR is computed. Modulus of subgrade reaction K is computed using Table-2, clause 5.7.3.4 of IRC:58.

d) Since, granular subbase and dry lean concrete is also proposed as part of the pavement crust, the modulus of subgrade reaction should be considered based on combined action of granular subbase and DLC. However, K value at subgrade corresponding to DLC is only considered in the analysis as per clause 5.7.4.4 and computed as per Table-4, IRC:58 is used in the analysis.

e) The design traffic for each homogenous section for commercial vehicles are projected upto design life. The design traffic is considered as 50% of the total traffic in both the directions, which is ascertained from traffic studies and analysis.

f) The total numbers of axles are computed and the sum product of the commercial vehicles upto design life and corresponding axle configuration. For ex. three axle truck consist of 1 front axle and 2 rear axles in tandem.

g) Number of single steering axles, single axles with dual wheel assembly on both sides and tandem axles are computed from the vehicular category.

h) The total traffic for bottom up cracking (BUC) is considered as 25% of the total traffic in predominant direction taking into account the lateral placement of load as per clause 5.5.2.3 of IRC:58.

i) The night time traffic (usually between 10 PM to 3AM) is considered as 60% of the total traffic. Balance traffic is considered as day time traffic loading. The total traffic considered for Bottom Up Cracking is considered as 50% of the day time traffic.

j) Proportion of commercial vehicles for which the distance between the front and rear axle is less than or equal to 4.5m is computed. The design load repetitions are computed as the proportion of commercial vehicles whose axle spacing is less than 4.5m for six hour night time traffic. This traffic is considered for Top Down Cracking.

The load from measurement of wheel load is converted to axle load and grouped them in size of 10 KN. The loading is further categorized into Single Axle, Tandem axle and Tridam axle. Abstract of the axle load group at various locations for left and right carriageway is given in Table 4-12.

Table 4-12: Abstract of Loading Spectrum

4.4 Design of Dowel Bar System

Load stresses at edge and corner regions of the slab at transverse joints are relieved by means of load transfer devises in the form of dowel bar. Dowel bar system required is computed in accordance with clause 7.2.1 of IRC:58.

4.5 Design of Longitudinal Joints

Longitudinal joints are provided in CC pavement to allow transverse cracking and warping. Design is carried out in accordance with Section 8 of IRC:58.

The design is calculated in MS Excel spreadsheet as per the guidelines given in IRC:58 and details given in soft form as part of the code. The pavement thickness is assumed and total cumulative fatigue life consumed for Bottom Up Cracking and Top Down Cracking is checked to be less than 1. In case, the fatigue life is more than 1, the pavement thickness is increased to limit the fatigue life less than 1.

4.5.1 Summary of flexible pavement design

Summary of the flexible pavement design for main road are as follows:

- Stone Matrix Asphalt with modified binder - 50mm
- Dense Bituminous Macadam - 115mm, 130mm,130mm
- Wet Mix Macadam - 250mm
- Granular Sub Base - 200mm
- CBR of the 500mm of subgrade - 8% (Minimum)
- CBR of soil below the 500mm of subgrade - 5% (Minimum)

4.5.2 Summary of rigid pavement design

- M40 Concrete Pavement Thickness (PQC) = 300mm
- DLC Thickness = 150mm (debonding layer 200 micron polythene sheet in between)
- GSB Thickness = 150mm
- Dowel Bar Dia = 38mm
- Length of Dowel bar(plain) = 500mm
- Spacing of Dowel bar(plain) = 300mm
- Tie Bar Dia (deformed) = 12mm
- Length of Tie bar (deformed) = 580mm
- Spacing of Tie bar (deformed) = 370mm

- Size of Panel = 3500mmX4500mm

4.6 Service Road

Service road is designed for loading of 20MSA and effective subgrade CBR is taken as 8%.The summary of the pavement composition is as follows

- Stone Matrix Asphalt (SMA) : 40mm
- Dense Bituminous Macadam (DBM) : 75 mm
- Wet Mix Macadam (WMM) : 250 mm
- Granular Subbase (GSB) : 200 mm
- CBR of the 500mm of the subgrade from borrow pits = 8%CBR (Minimum)
- CBR of soil below the 500mm of the subgrade = 5% CBR (Minimum)

SECTION – 5

CROSS DRAINAGE STRUCTURES

5 CROSS DRAINAGE STRUCTURES

5.1 General

The proposed PRR is a green field project, its alignment passing through mix of agricultural and developed areas. The alignment crosses natural streams / water course / nallah. This report covers the following:

- Brief methodology followed for carrying out hydraulic design for the construction of small bridges and culverts across various nallah along the proposed alignment.
- Hydrological and hydraulic study to determine the required size of the drainage structures to allow the estimated design flow.

5.2 Hydraulic Designs - General Design Basis

Hydraulic designs for cross drainage structures are carried out based on guidelines given in following IRC codes of practice:

- IRC:SP:13-2004 - Guidelines for the design of small bridges and culverts.
- IRC:SP:42-2014 - Guidelines for the road drainage.
- IRC:SP:50-2013 - Guidelines for urban drainage.

The design of the drainage system involves (i) calculating the total discharge that the cross drainage structure will require to drain off (Hydraulic analysis) and (ii) fixing the slope and dimensions of the cross drainage structures to have adequate capacity to carry the discharge and afford proper maintenance.

For small water sheds not exceeding 25Km2, the rational method is widely used for estimating the peak run off rates. The rational method is an universally accepted procedure which is based on empirical formulae relating rainfall to runoff. The method is widely used due to simplicity. The formulae is

Q=0.028 x P x A x Ic.....Equation 5-1

Where,

- Q= Design peak runoff rate in m3/sec.
- P= Co-efficient of runoff for catchment characteristics.
- A= Area of catchment in hectares.
- Ic= Critical intensity of rainfall in cm per hour for the selected frequency and the duration.

Suggested values of runoff coefficient as per clause 4.7.7 of IRC SP-13 (2004) is given in Table 5-1.

Table 5-1: Runoff coefficients for various types of strata

Sl. No.	Type of surface	Runoff Coefficient
1	Steep, bare rock and also city pavements	0.9
2	Rock, steep but wooded	0.8
3	Plateaus, lightly covered	0.7
4	Clayey soils, stiff and bare	0.6
5	Clayey soils, stiff and bare lightly covered	0.5
6	Loam, lightly cultivated or covered	0.4
7	Loam, lightly cultivated or covered largely cultivated	0.3
8	Sandy soil, light growth	0.2
9	Sandy soil, light growth covered, heavy brush	0.1

5.2.1 Critical and Design Intensity (i):

The critical intensity for a catchments is that maximum intensity which can occur in a time interval equal to the concentration time 't' of the catchments during the severest storm (in the region) of a given frequency 'i'. Since each catchment has its own 't', it will have its own 'i'.

$i=(F/T)\{(T+1)/(t+1)\}$..... Equation 5-2

Where,

- i=Intensity of rainfall within a shorter period of 't' hours within a storm.
- F=Total rainfall in a storm in cm falling in duration of storm of 'T' hours.
- T=Duration of total rainfall (F) in hours
- t=Smaller time interval in hours within the storm duration of 'T' hours.

Rainfall intensity chosen for the design depends on category and importance of the road section as per clause 7.1.4 of IRC:SP:42-2014, road category of NH and above should be designed by considering 50 year rainfall intensity (50 year one hour maximum rainfall). Flood estimation report, prepared jointly by CWC, MORTH, IMD and DRDO and published by Central Water Council (CWC) for different sub zones in India is shown in Figure 5-1. Bangalore comes under Kaveri Basin Sub-Zone 3(i).

Iso-Pluvial map for 50 Year-24 Hour Rainfall published in Flood estimation report for Kaveri Basin Sub Zone-3(i) is shown in Figure 5-2. Time distribution for 50 Year 7hour Areal Rainfall is shown in Figure 5-3. The rainfall occurred in a watershed is not same over the

whole watershed. It may be low in a part of watershed and high in other part of watershed and therefore, this should affect the runoff. To account this in the designs a conversion factor known as Areal Spread Factor is derived from a graph represented in IRC:SP:42-2014 which is shown in Figure 5-4.

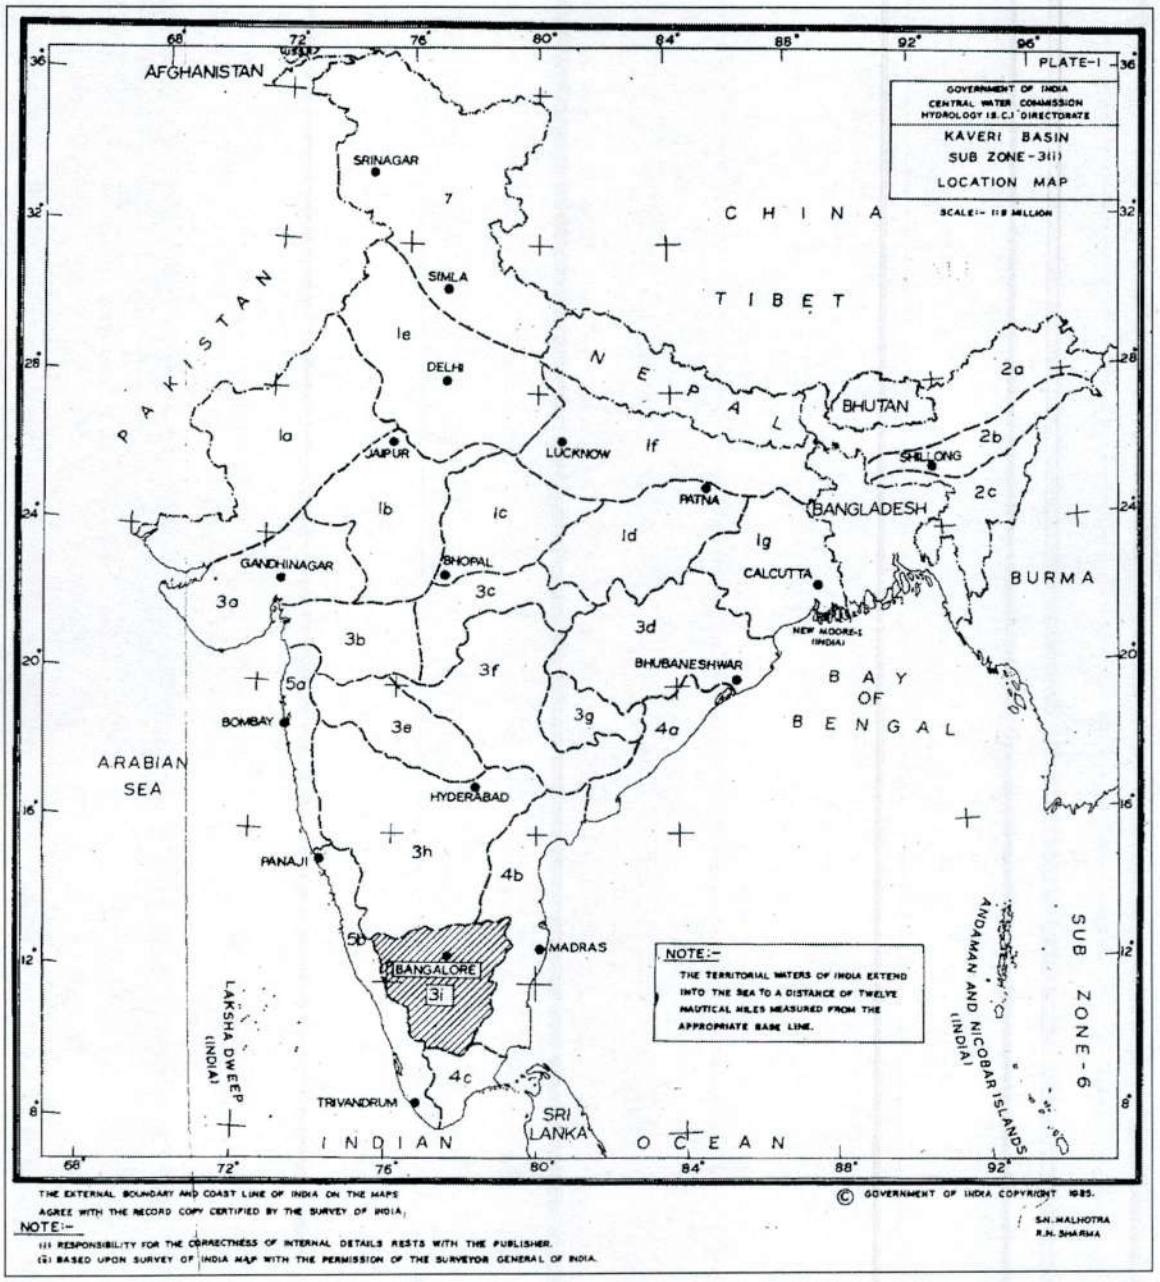

Figure 5-1: Map of India showing Sub-Zones and State Boundaries

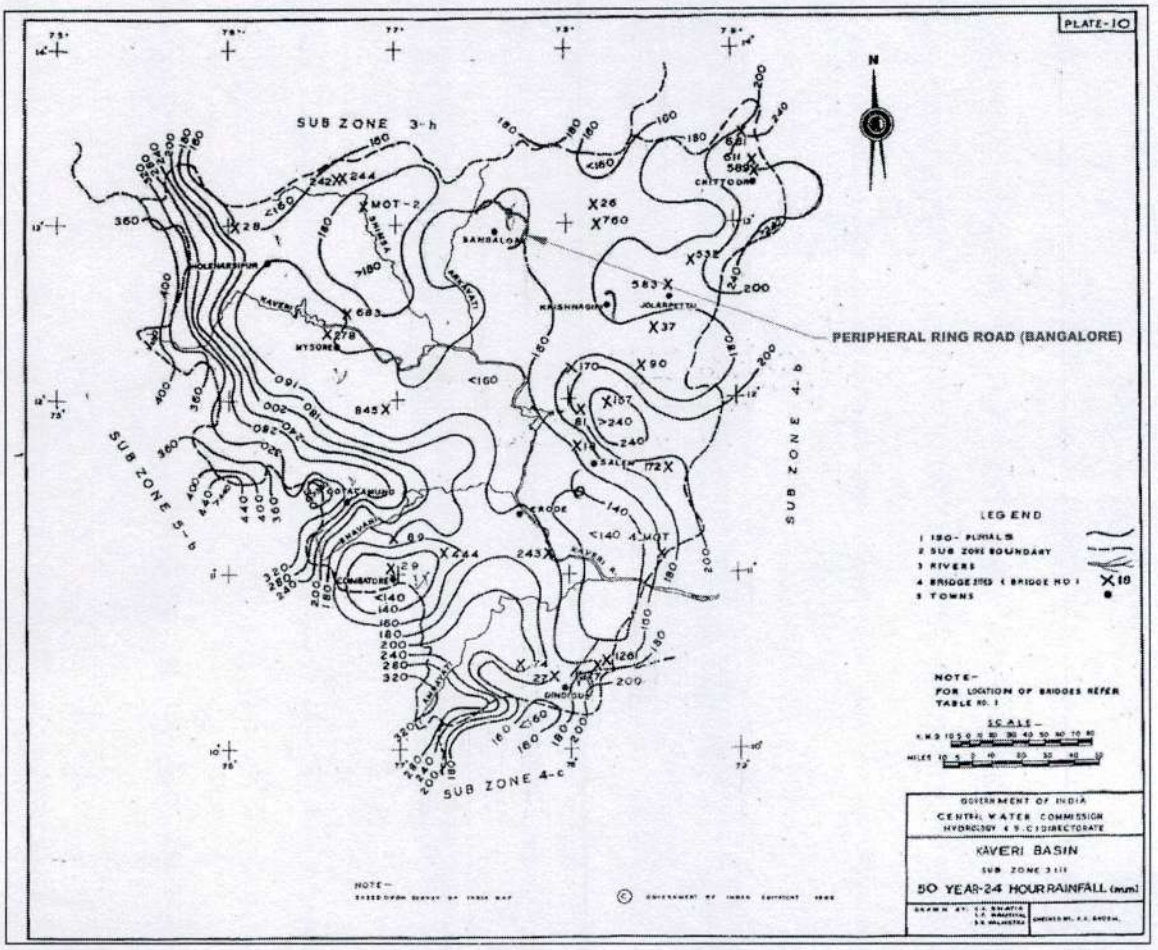

Figure 5-2: 50 Year-24 Hour Rainfall (mm)- Kaveri Basin Sub Zone 3(i)

Duration (hrs.)	Distribution Co-efficients	Areal Storm rainfall (cm)	1-hr. rainfall (cm)
(1)	(2)	(3)	(4)
7	1.00	10.23	0.31
6	0.97	9.92	0.30
5	0.94	9.62	0.52
4	0.89	9.10	0.61
3	0.83	8.49	0.82
2	0.75	7.67	1.33
1	0.62	6.34	6.34

Figure 5-3: Time distribution of Areal Rainfall (50 Year 7 hour Rainfall)

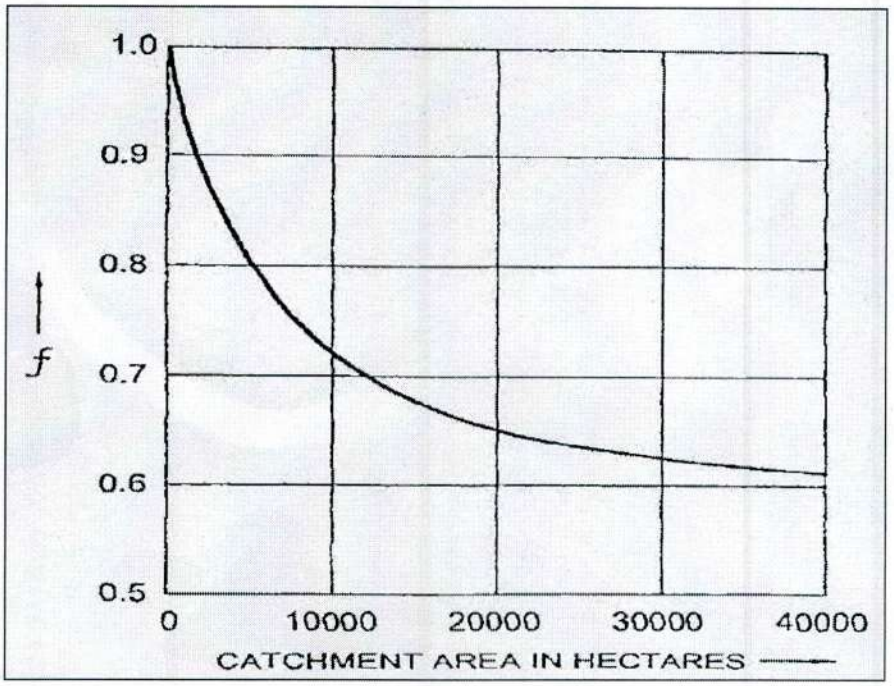

Figure 5-4: Arial Spread Factor v/s Catchment Area

5.2.2 Time of Concentration

It is the time required for maximum runoff rate to develop. It is equal to the time required for a drop of water to run from the most remote point of the road surface to the point for which the runoff is being estimated. Empirical formula given in IRC:SP:13-2004 is used to determine the time of concentration which is shown below:

$Tc=\{0.87\times(L^3/H)\}^{0.385}$.....Equation 5-3

Where,

- Tc = Time of concentration in hours
- L=Distance of critical point to the cross drainage structure, in Km
- H=Fall in level from the critical point to the drain level in meters

5.3 Hydraulic design of culverts

Once the quantity of runoff is determined, hydraulic design of culvert is carried by estimating the drain capacity using Manning's formula.

Q = A x V.....Equation 5-4

Where,

V= (1/n) x R2/3 x S1/2.....Equation 5-5

Q= (1/n) x A x R2/3 x S1/2.....Equation 5-6

Where,

- Q= discharge in cum/sec
- V=Mean velocity in m/sec
- n=Manning's roughness coefficient
- R=Hydraulic radius in m which is area of flow cross section divided by wetted perimeter.
- S=Longitudinal gradient of culvert
- A=Area of the flow cross-section in m2

The coefficient of roughness for various surfaces are given in IRC:SP:42-2014 is used to adopt manning's coefficient (ref Table 5-2).

Table 5-2: Suggested values of Manning's coefficient (n)

Sl. No.	Type of surface	value of 'n'
1	Brick pitched Drain	0.017
2	Plastered Brick Drain	0.015
3	Plastered brick surface with near cement finish	0.013
4	concrete pipes upto 600mnm dia	0.015
5	concrete pipes above 600mnm dia	0.013
6	Dry rubble masonry	0.033
7	Dressed Ashlar surface	0.015
8	Dry stone pitching	0.020
9	Kutcha Drain	0.025

5.3.1 Vertical Clearance

Minimum vertical clearance for cross drainage structure as per clause 12.3, IRC:SP:13-2004 is shown in Table 5-3.

Table 5-3: Vertical clearance details for CD structure

Discharge in m3/sec	Minimum vertical clearance, m
Upto 0.3	0.150
0.3 to 3	0.450
3 to 30	0.600
30 to 300	0.900
300 to 3000	1.200
Above 3000	1.500

5.4 Design steps of hydraulics calculation

Following are the considerations made in the culvert hydraulics calculation.

- Collection of Topo-sheets for the particular project.
- Identify the streams or nallah for which the cross drainage structure is proposed superimposed on PRR alignment.
- Mark the catchment area on Topo sheet. The catchment area (A) is expressed in hectares.
- On the toposheet, the remotest point or farthest point of the particular catchment is identified. The distance upto the proposed cross drainage structure is measured {Distance (L) expressed in KM}.
- The fall in level (H) between the farthest point and at cross drainage structure is calculated.
- The time of concentration (Tc), using the above Equation 5-3 is computed.
- Next step is to evaluate the Critical intensity of rainfall (i). One hour highest rainfall for return period of 50 years is arrived using (Figure 5-2 and Figure 5-3). For Bangalore region one hour maximum rainfall shall be 100mm/1 hr. Discharge for particular catchment is estimated by a rational method using Equation 5-1.
- Next step is to assess the vent way size for the cross drainage structure. Using manning's formula (Equation 5-4), the capacity of the cross drainage structure is calculated and vent way size (Breadth and Height, height shall be inclusive of vertical clearance), roughness coefficient (n, from Table 5-2), Longitudinal slope (S) is selected. Discharge is calculated using Equation 5-4. The calculated discharge should be more than the generated discharge for the particular catchments. Otherwise, the hydraulic particulars of cross drainage structure are varied until calculated discharge (vent way size, longitudinal slope) greater than generated discharge.

5.5 Hydraulics calculations and Recommended CD structures

The summary of the hydrological and hydraulic calculations of all the Nallahs are given in Table 5-4 and Table 5-5.

Catchment area details for few cross drainage structures are shown from Figure 5-5 to Figure 5-7 and proposed land use plan is given in Figure 5-8.

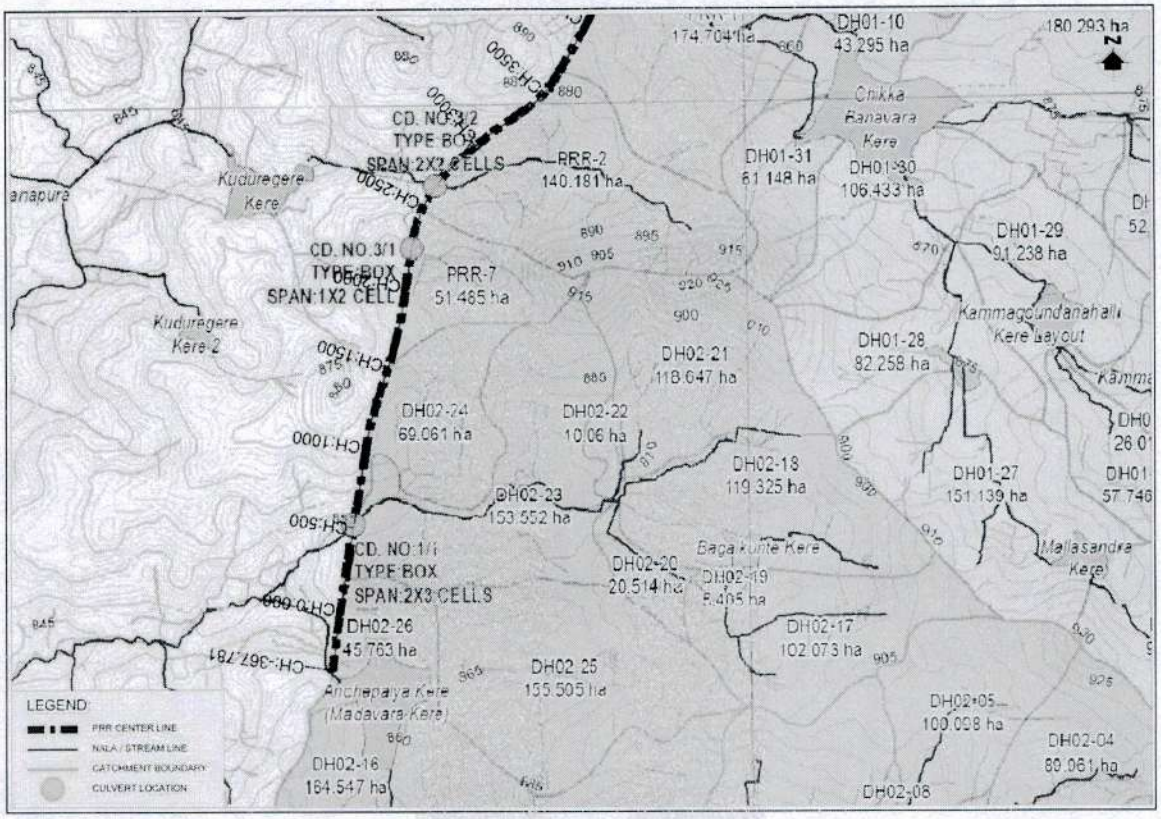

Figure 5-5: Catchment area details for CD structures C1 to C3

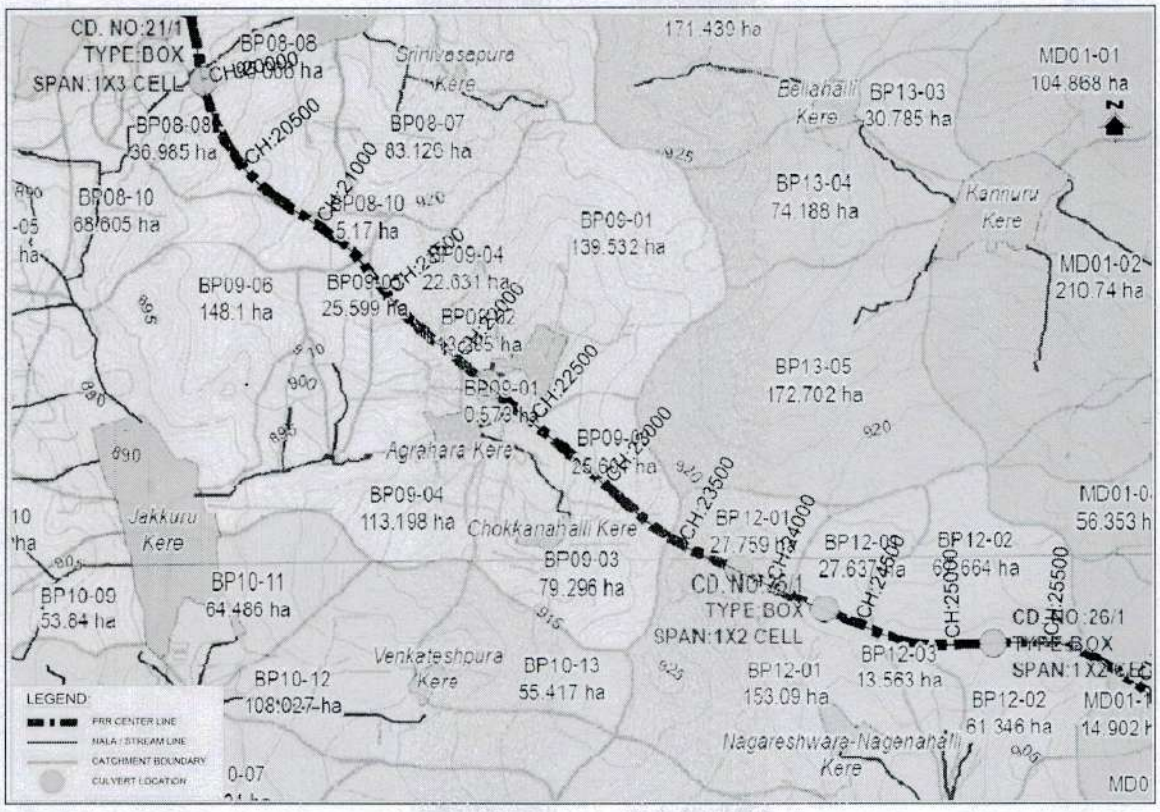

Figure 5-6: Catchment area details for CD structures C17 to C21

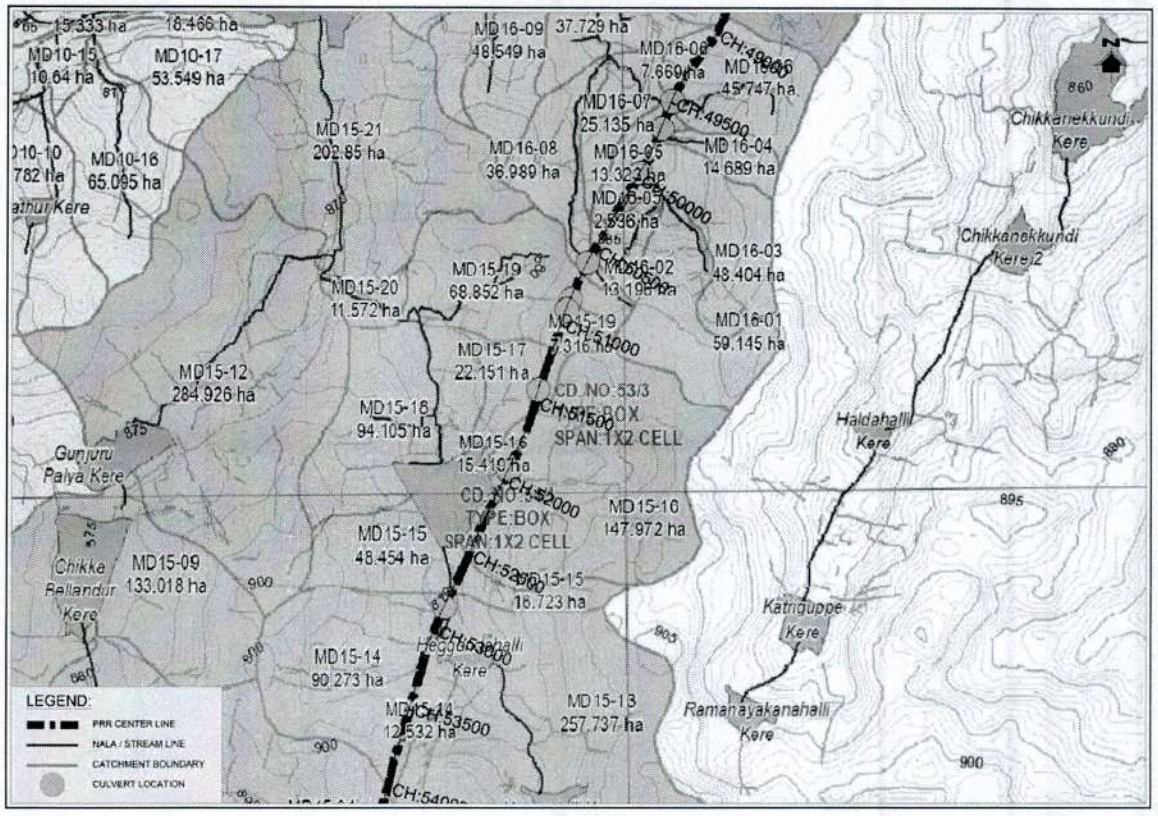

Figure 5-7: Catchment area details for CD structures C47 to C53

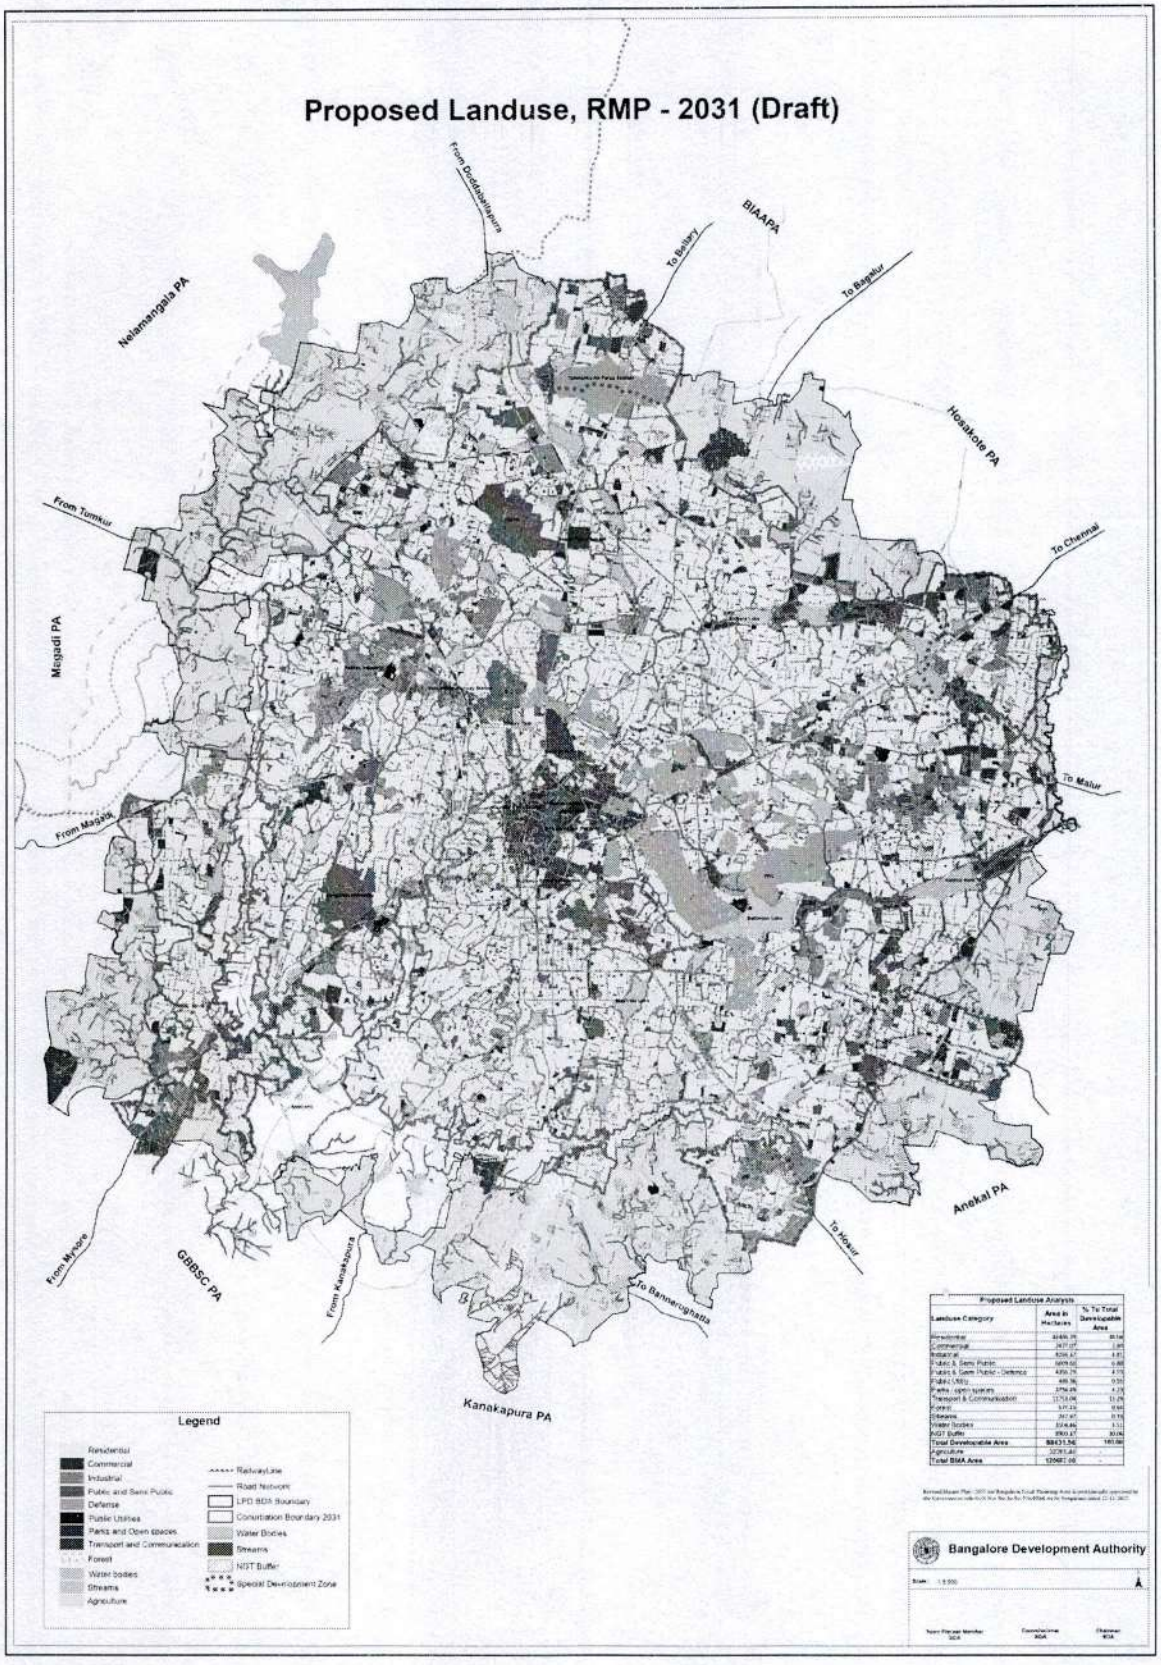

Figure 5-8: Proposed Landuse, Revised Master Plan - 2031

5.6 Other Points

- Maximum hourly rainfall , for a 50 year return period is taken as 100mm / 1 hour for Bangalore region.
- Longitudinal slope of box culvert is varied from 1 in 200 to 1 in 1000 (i.e. S=0.005 to 0.001).
- Discharge velocity is assumed as 3 m/sec for all the above calculations.

Sl No		Design Chainage,m	Location
11	Whitefield road grade separator	38986.000	Entry and Exit plaza – left side of interchange
12		40958.000	Entry and Exit plaza – right side of interchange
13	Channasandra road grade separator	43295.000	Entry and Exit plaza – left side of interchange
14		44418.000	Entry and Exit plaza – right side of interchange
15	B'lore Sarjapura road grade separator	54632.000	Entry and Exit plaza – left side of interchange
16		56368.000	Entry and Exit plaza – right side of interchange
17	Hosur road interchange	63075.000	Main road toll plaza

Design Elements for Toll Plaza is given in following sections.

7.4.1 Layout

Two types of toll plaza layouts are proposed for PRR. They are:

- Toll Plaza on main road at start and end of the project road integrated with NICE road (ref Figure 7-1).
- Toll Plaza at entry and exit of interchanges. These are provided at 8 intermittent junctions to capture traffic from side roads (ref Figure 7-2).

Adequate numbers of toll lanes are proposed at each toll plaza. The number of toll lanes will be two for regular traffic and one for oversized vehicles to start with, but the layout has adequate provision for expansion to cater for future traffic.

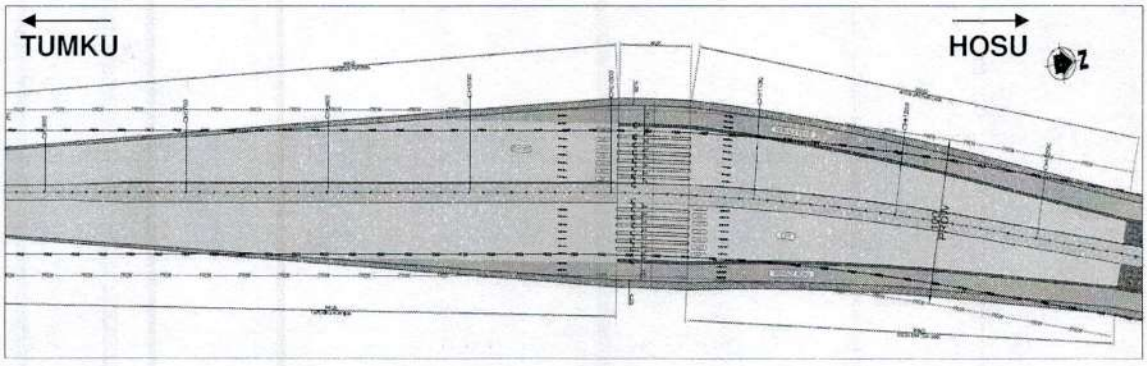

Figure 7-1: Main Toll Plaza at Tumkur Road

facilities like toilets, dormitory, rest rooms, medical shops, dispensary, ATMs. In addition, rest area will also comprise of sufficient working area and space for repair shops, vulcanizing shops, service centre, spare parts shops, telephone booth, hotels and light refreshments with first aid facilities can be provided. Rest area will be adequately lit with high mast lighting. The whole area will be elaborately landscaped to provide a pleasing environment.

7.4 Toll Plaza

The main road of PRR will be a tollable road. The project road starts at NH-4 on Tumkur road and ends at NH-7 on Hosur road integrating with existing NICE road thereby completing "full circle" of road network. There are 10 major intersection points along PRR. BDA is desirous of collecting toll for main road users. Details of proposed Toll Plazas at all 10 locations are mentioned below in Table 7-2.

Typically, two types of toll plazas are proposed:

- Toll Plaza on main road at Tumkur and Hosur end to capture and toll traffic coming to / from NICE road.
- Toll Plaza at entry and exit to main road from side roads at all major junctions.

Table 7-2: Locations of Toll Plazas

Sl No		Design Chainage,m	Location
1	Tumkur road interchange	1030.000	Main road toll plaza
2	Hessarghatta ROB / Grade Separator	5500.000	Entry and Exit plaza – right side of interchange
3	Doddaballapur road grade separator	13365.000	Entry and Exit plaza – left side of interchange
4		15616.000	Entry and Exit plaza – right side of interchange
5	Bellary road grade separator	17840.000	Entry and Exit plaza – left side of interchange
6		19540.000	Entry and Exit plaza – right side of interchange
7	Hennur road grade separator	24600.000	Entry and Exit plaza – left side of interchange
8		26434.000	Entry and Exit plaza – right side of interchange
9	Old Madras road grade separator	35085.000	Entry and Exit plaza – left side of interchange
10		36934.000	Entry and Exit plaza – right side of interchange

53	61.800	LHS &RHS	Doddanagamangala
54	62.750	LHS &RHS	Doddanagamangala

7.3.2 Rest Areas

Rest areas are proposed at 3 locations, one each in each sections. These are proposed to be located near to Interchanges / toll plazas. The exact location of rest area will be dependent on land acquisition extents proposed by BDA. Typically, rest area will include

4	4.800	LHS &RHS	Chikkabanavara
5	6.900	LHS &RHS	Kalathammanahalli
6	7.750	LHS &RHS	Byalakere
7	8.700	LHS	Byalakere
8	9.050	RHS	Byalakere

30	31.350	LHS	Aduru
31	31.650	RHS	Aduru

800mm. They are proposed at approaches to bridge structures and median of toll plaza islands.

7.2.6 Kilometer Stone

The details of kilometer stones are in accordance with IRC: 8-1980 guidelines. Kilometer stones are located on the left-hand side of the road as one proceeds from the station from which the Kilometer count starts. Kilometer stones shall be fixed at right angles to the centre line of the carriageway.

The details of 200m stones and boundary stones conform to IRC: 26-1967 and IRC: 25-1967. 200m stones are located on the same side of the road as the kilometer stones. The inscription on the stones shall be the numerals 2, 4, 6 and 8 marked in an ascending order in the direction of increasing kilometer away from the starting station. The numerals shall be 80mm high. The colour of the numerals shall be black on a white background. Boundary stones shall be located on either side of the road opposite every 200m stone and kilometre stone. In addition these shall be fixed at all angular points of the boundary. Where the boundary is on a curve or the land is of significant value and likely to be encroached upon, the boundary stones, as required, shall be installed at closer intervals.

7.3 Way Side Amenities

Various amenities proposed for the project include bus shelters, rest areas and toll plazas. These are explained in following section.

7.3.1 Bus Shelters

Exclusive bus bays are not provided on the project road. BMTC buses are expected to move on service road. Since the project road has to be confined within 75m ROW, exclusive bus bays as per IRC cannot be provided. Hence, only bus shelters are proposed. Bus shelters are proposed without taper. A raised footpath of 2.0 m wide is proposed along with shelter for the safety of waiting passengers. The locations of proposed Bus shelter are presented in Table 7-1.

Table 7-1: Location of Bus Shelters

Sl No	Design Chainage,Km	Side	Location
1	1.450	LHS &RHS	Totadaguddahalli
2	2.450	LHS &RHS	Tammenahalli
3	3.700	LHS &RHS	Soladevanahalli

Centre, edge line, stop line, give way line, diagonal/chevron markings, parking etc shall be painted with hot applied thermoplastic paints with reflect rising glass beads as per MOSRTH specification. At toll plaza, transverse bar lines with width of 300 mm and spacing 15-20 m @ c\c shall be provided across the flare approach to toll plaza to reduce speed of vehicles.

7.2.3 Road Delineators

Roadway indicators are intended to mark the edges of the roadway so as to guide drivers on the alignment ahead. Hazard markers used to define obstructions like guardrails and abutment adjacent to carriageway and bridges which are narrower than the normal width.

Object markers are used to indicate hazards and obstructions within the vehicle flow path, for example, channeling islands close to the intersections.

Delineators and object markers are provided in accordance with the provisions of IRC:79. They are basically driving aids and should not be regarded as substitutes for warning signs, road markings or barriers.

7.2.4 Metal Crash Barrier

Metal Beam Crash Barrier is proposed all along the stretch at superelevated sections, sides of drain separating main road and service road. Thire Metal beam rail shall be of W-profile corrugated sheet steel beams comply with the following mechanical properties.

- Tensile strength, Min = 483 MPA
- Elongation in 2 inches, Min = 12%
- Yield, Min = 345 MPA

The beam elements shall have nominal width of 483mm. Post consists of formed channel of size 150 x 75 x 5, 785mm long and space consists of formed channel of size 150 x 75 x 5, 330 mm long. All members of the system should be hot dipped galvanized to have a minimum counting of 550g/sqm, each face in compliance to relevant MOSRT&H Specification (Cl. 810). The spacing of posts should be 2.0m c/c. Crash barrier system absorbs impact of vehicle and laterally restrains a vehicle from veering off. This ensures minimum damage to the vehicle and passengers.

7.2.5 Concrete Crash Barrier

New jersey concrete barriers are rigid barriers having specifically designed to minimize damage and reduce the likelihood of a car crossing into oncoming lanes in the event of a collision. The barrier will be of pre-cast in M 30 concrete grade preferably having height of

7 TRAFFIC SAFETY AND APPURTENANCES

7.1 General

The proposed PRR will be in urban section for most of the length. The main road will be an access controlled road for fast moving traffic while service road will cater for slow moving and pedestrian traffic. While it is necessary to plan and design the roadway features of the road like geometry, pavement and structures, it is equally important to ensure that the road so designed has adequate safety devises and appurtenances.

Traffic control devices/Road safety devices/Road side furniture will comprise of road signs, road markings, objects / hazard markers, road studs, roadway delineators, attenuators, safety barriers, pedestrian guard rails, metal crash barriers, boundary stones, kilometer stones, etc.

7.2 Road Furniture

Various types of road furniture proposed for the project are given in following sections.

7.2.1 Road Signs

The three type of road signs viz Cautionary, Mandatory and Informatory signs have been provided depending on the situation and function they perform in accordance with the IRC: 67-2012 and Section 802 of MORTH guidelines . Kerb mounted sign shall be supported on GI pipe and overhead sign shall be structurally supported gantry or cantilever. Road sign on main road will be with inserts from drain top / at side of central median, while road sign installation on service road will be on footpath edge.

All road signs shall be of prismatic grade sheeting corresponding to Class C sheeting and any types of IX or X as per ASTM standards.

7.2.2 Road Markings

Road markings perform the important function of guiding and controlling traffic on a highway. The markings serve as psychological barriers and signify the delineation of traffic paths and their lateral clearance from traffic hazards for safe movement of traffic. Road markings are therefore essential to ensure smooth and orderly flow of traffic and to promote road safety. The Code of Practice for Road Markings, IRC: 35- 1997, has been used in the study as the design basis.

The location and type of marking lines, material and color is followed using IRC: 35-1997 "Code of Practice for Road Markings".

SECTION – 7

TRAFFIC SAFETY AND APPURTENANCES

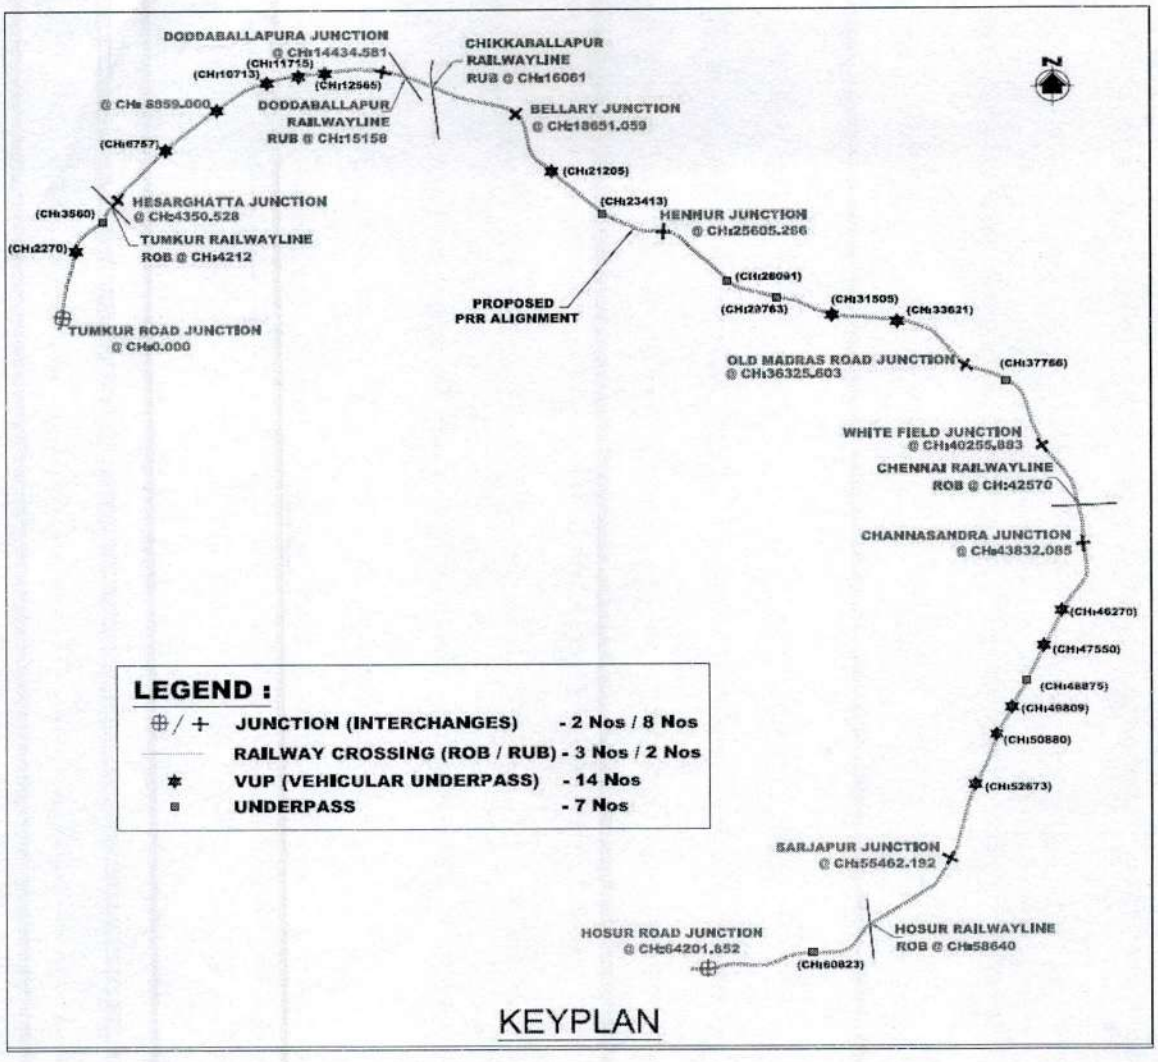

Figure 6-2: Key Plan showing locations of Interchanges, VUP, ROB/RUB

Following are the list of flyovers / grade separators proposed for the project.

Table 6-1: List of proposed grade separators

Sl. No.	Chainage, Km	Intersecting Road Name	Suggested Proposal
1.	0.000	Tumkur Road (NH-4)	Cloverleaf interchange integrated with NICE road
2.	4+350.528	Hesarghatta Road	Flyover along PRR
3.	14+434.581	Doddaballapur	Vehicular underpass along PRR
4.	18+651.059	Bellary Road (NH-7)	Vehicular underpass along PRR
5.	25+605.266	Hennur Road	Vehicular underpass along PRR
6.	36+325.603	Old Madras Road (NH-4)	Flyover along PRR

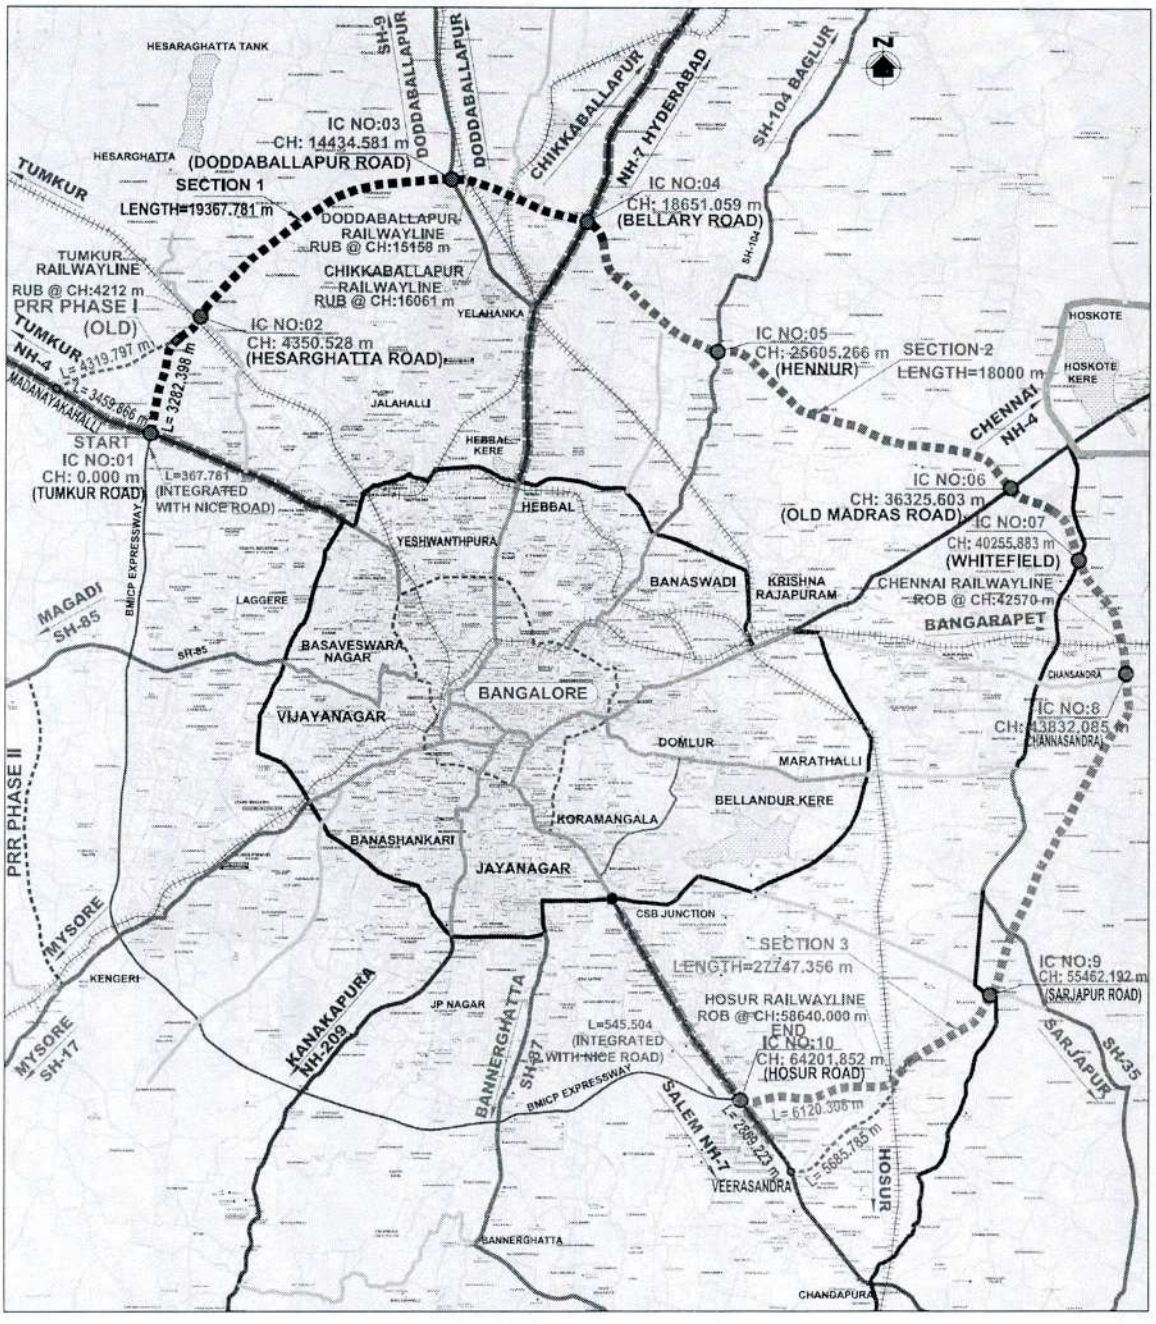

Figure 6-1: Key Plan showing locations of Intersections

6 GRADE SEPARATORS

6.1 Introduction

The project road crosses major junctions at 10 locations and railway crossings at 5 locations. Key Plan showing major junction and railway crossings are given in Figure 6-1 and details of proposal for major intersections is given in Table 6-1 and railway crossings in Table 6-2.

As the project road is fully access control, underpasses are proposed for cross road traffic to cross the PRR without obstructing the main stream traffic. Key Plan showing location of facilities proposed is given in Table 6-3.

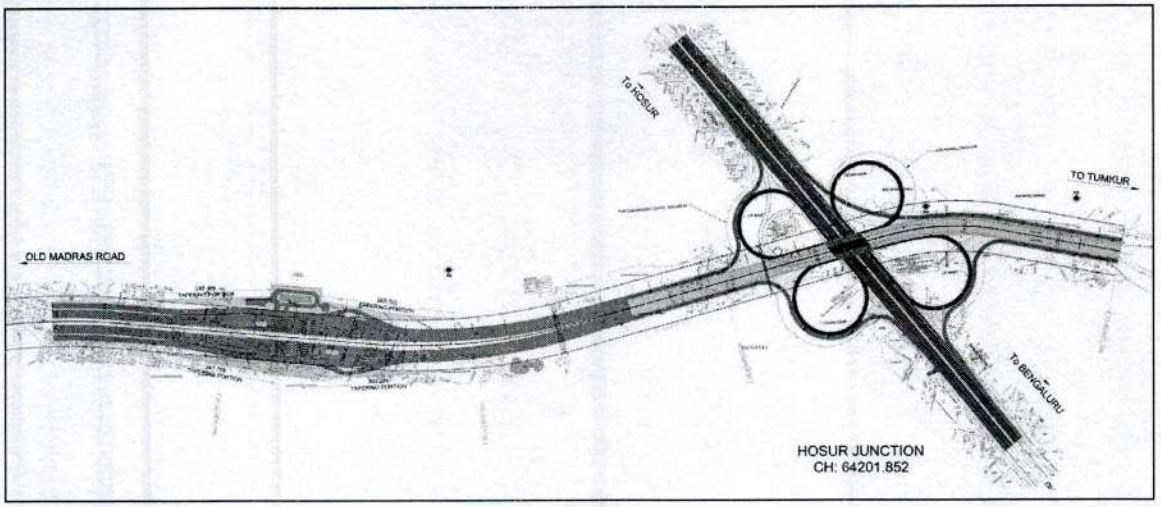

Figure 6-12: Proposed Cloverleaf Interchange at Hosur Road

-----XXXXX-----

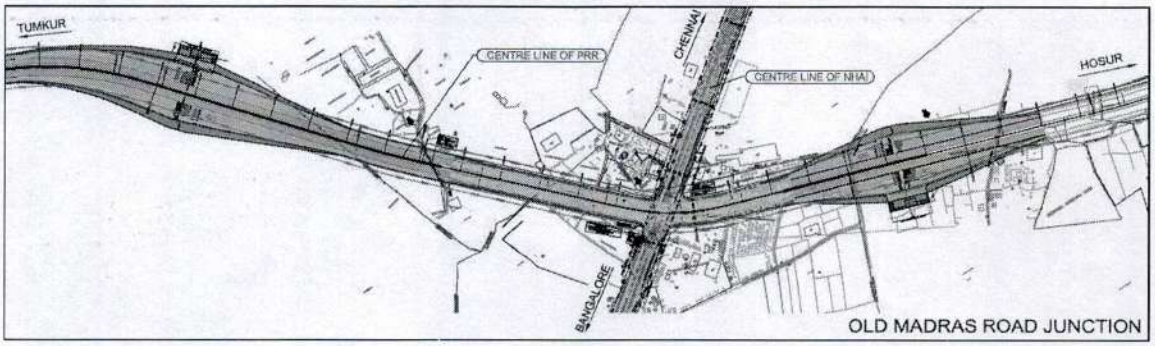

Figure 6-8: Revised Grade Separator Option at Old Madras Road Junction

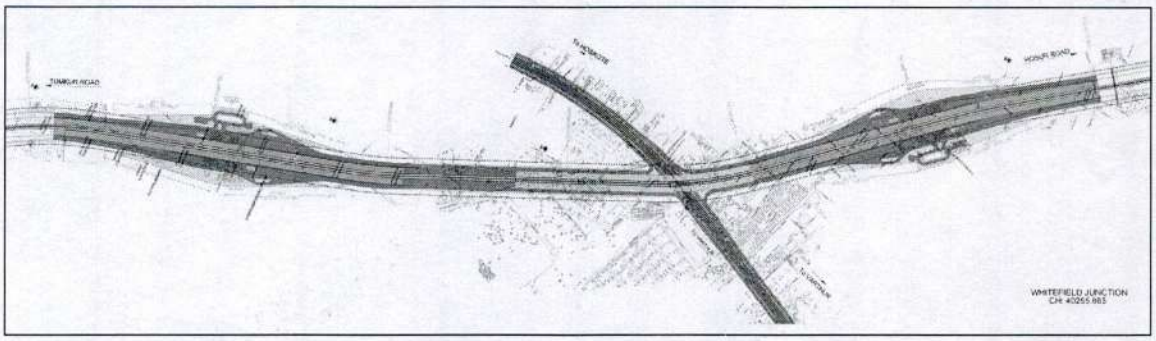

Figure 6-9: Proposed Flyover at Whitefield Junction

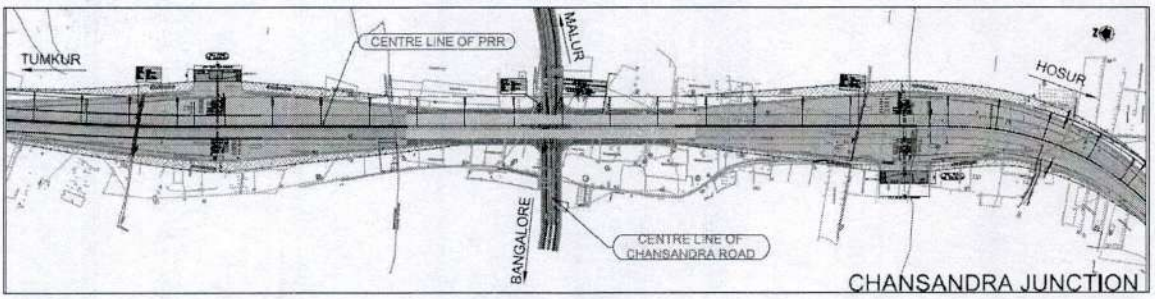

Figure 6-10: Proposed Grade Separator at Channasandra Junction

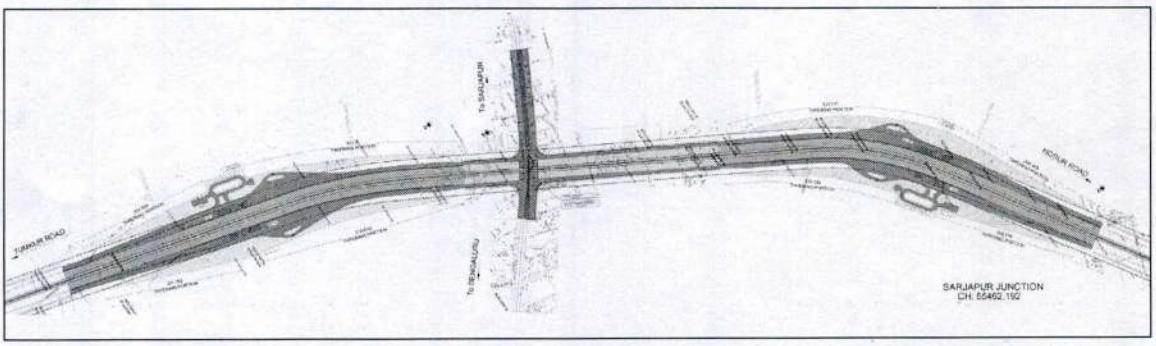

Figure 6-11: Proposed Underpass at Sarjapura Junction

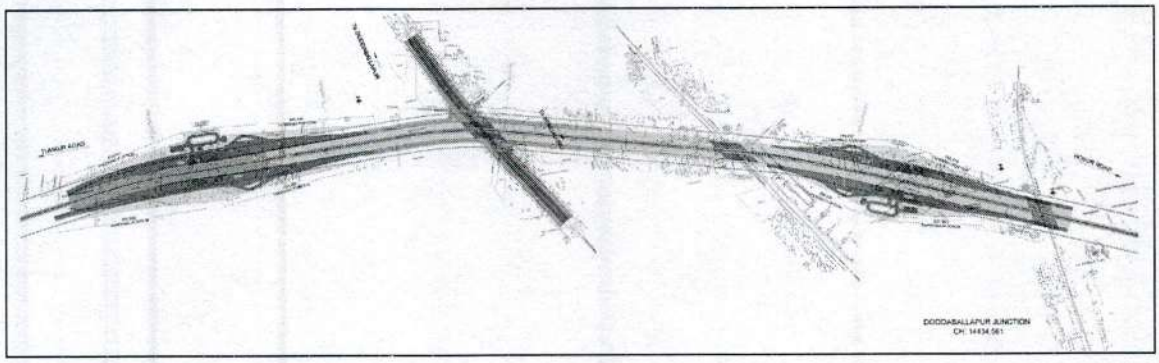

Figure 6-5: Proposed Underpass at Doddaballapur Junction

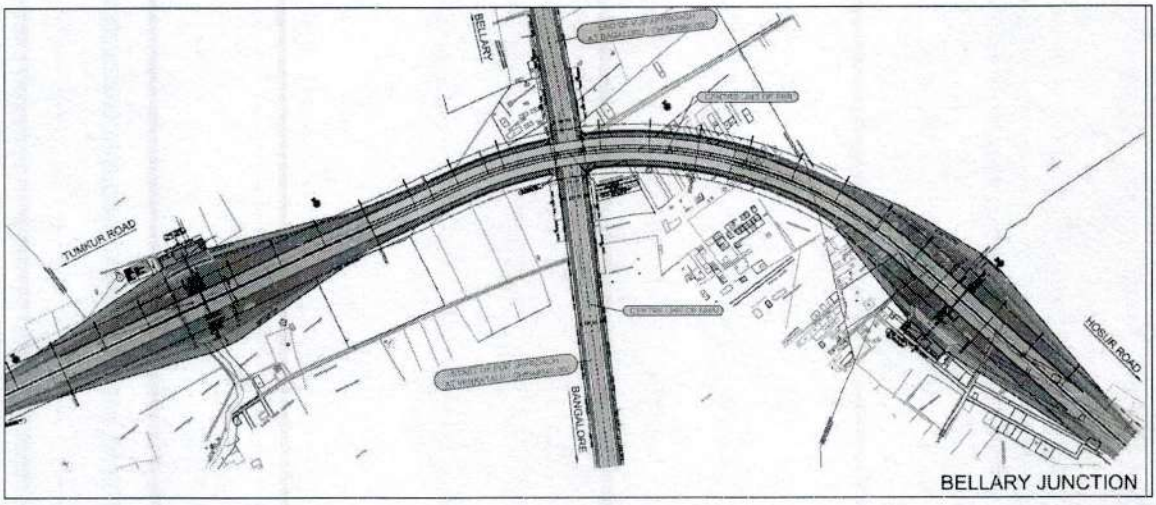

Figure 6-6: Revised Grade Separator Option at Bellary Junction

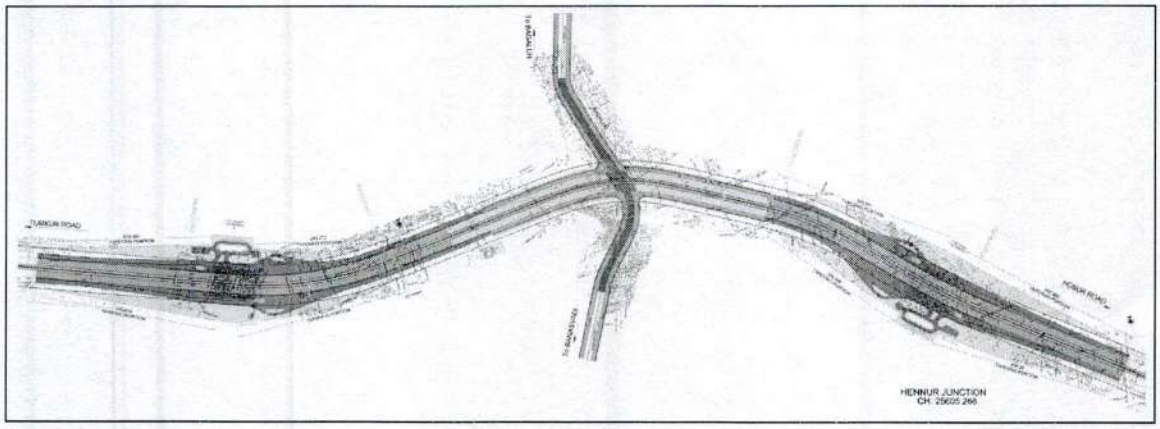

Figure 6-7: Proposed Underpass at Hennur Junction

prepared and presented to Technical Advisory Committee on 16/01/2029 and 05/02/2019. Part plan of grade separators at all 10 junctions with toll plazas on either side is given from Figure 6-3 to Figure 6-12.

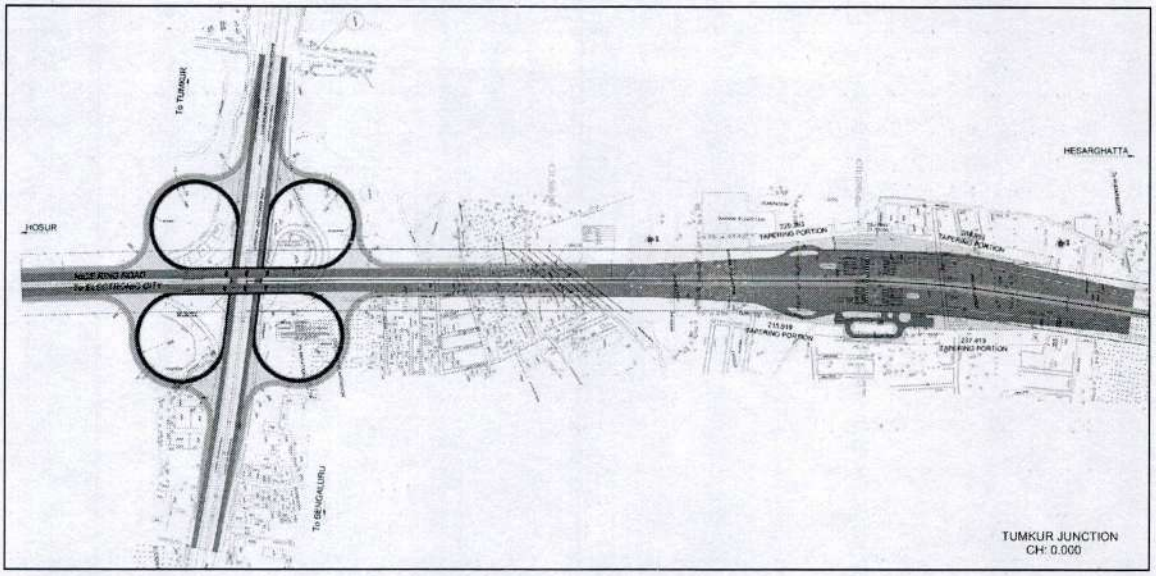

Figure 6-3: Proposed Cloverleaf interchange at Tumkur Road

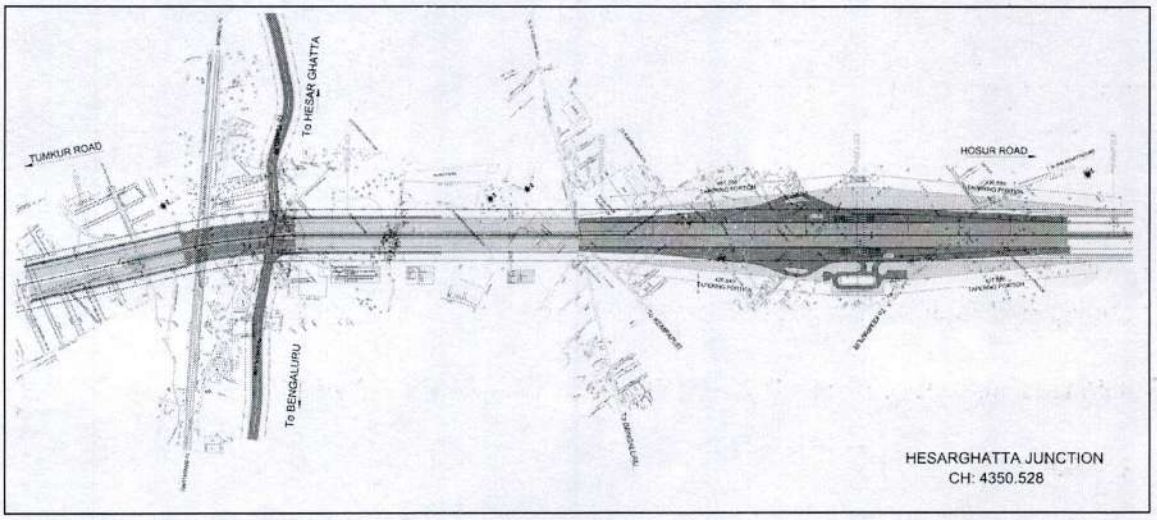

Figure 6-4: Proposed Flyover at Hessaraghatta Junction

SL No	Design Chainage		Length (m)	Type of Cross Section	Remarks		
	From	To			Structure Type	Chainage (m)	Radius of curvature (m)
10	46225.000	46315.000	90.000	5	VUP	46270.000	Straight
11	47505.000	47595.000	90.000	5	VUP	47550.000	Straight
12	49764.000	49854.000	90.000	5	VUP	49809.000	1000
13	50835.000	50925.000	90.000	5	VUP	50880.000	2600
14	52628.000	52718.000	90.000	5	VUP	52673.000	Straight

Table 6-4: List of Proposed Vehicular Overpass

Sl No	Design Chainage, Km	Location
1	3.560	Chikkabanavara to Soladevanahalli
2	23.413	Nagavara to Byalahalli
3	28.091	Bileshivale to Doddagubbi
4	29.763	Rampura to Anagalapura
5	37.766	Doddabanahalli to Kannamangala
6	48.875	Chikka Tirupathi to Mutsandra
7	60.823	Silicon Town to Rayasandra

Note : It may be noted that locations of underpasses and overpasses may undergo change w.r.t location and site requirements during construction. Generally all existing cross roads including RMP roads are proposed to be connected to service roads of PRR.

Toll Plazas are proposed on either side of grade separators at 10 junctions.

6.2 References

Designs of interchanges are carried out in accordance following IRC codes:

- IRC: SP: 90-2012- Manual for Grade separators and elevated structures.
- IRC: 92-1985 – Guidelines for the design of interchanges for the urban area.

6.3 Changes from Earlier DPR

The earlier version of the Detailed Project Report was prepared considering 13 grade separators. BDA has asked the consultant to simplify clover leaf interchange facility at Bellary Road and Old Madras Road considering the land acquisition. Layout plans are

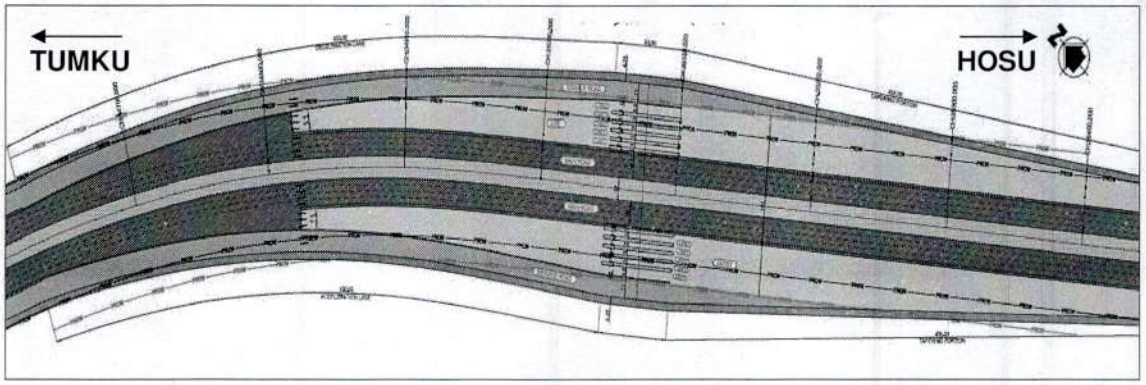

Figure 7-2: Toll Plaza at Intermittent Location

7.4.2 Toll Lane Width

The width of each toll lane is 3.5 m for ETC lanes, 3.2m for other lanes except for the lane for over dimensioned vehicles, where it is be 5.5 m.

7.4.3 Traffic islands at the toll plaza

Between each toll lane of the toll plaza, traffic islands are required to accommodate toll booth. These islands shall be of minimum 25 m length and 2.0 m width. New Jersey Crash barrier will be provided with "bull nose" in front of the median for traffic safety.

7.4.4 Toll booths

Toll booths may be provided of prefabricated materials or of masonry. The toll booths shad have adequate space for seating of toll collector, computer, printer, cash box, etc. It should have provision for light, fan and air-conditioning. Toll booths will be located within toll islands. Toll booth protection in the form of steel frames / GI pipes is provided around the booth.

7.4.5 Canopy

All the toll lanes and toll booths shall be covered with a canopy. The canopy shall be wide enough to provide weather protection to toll operators, drivers and facilities. The canopy shall be of aesthetically pleasing design with cylindrical support columns located at traffic island so that there is no restriction on visibility and traffic movement. Vertical clearance of 8m is proposed considering movement of oversized vehicles.

7.4.6 Toll plaza complex

Toll Plaza administrative building is proposed to be provided adjacent to toll plaza with provision of tunnel from toll booths to administrative building. Administrative building will have facility to provide comfortable office space for manager, cashier and other staff. There will be separate rooms for TV monitors, meetings, visitors, counters to issue passes and smart cards to road users, dormitory, shift change room, toilets etc. The building will also have a strong room for keeping the cash. A garage to accommodate the security van (during operation of loading the collected revenue) will be located adjacent to toll plaza. There shall be parking space in the same campus for vehicles for the staff and workers and other vehicles engaged in the operation of the Project Highway.

7.5 Landscaping and Arboriculture

Aesthetic of areas surrounding the roadways are a prime consideration in the design of roads. This must be in the line with road safety considerations. Landscaping of the environment in the vicinity of roads contributes in a number of ways like:

- Control of soil erosion
- Noise abatement
- Safety barrier
- Glare reduction at night from on coming traffic
- Visual barrier where ever required
- Indicative guide for direction of traffic movement
- Scenic beauty – psychological comfort

Space available within 100m ROW for landscaping and arboriculture for the project road are at:

- Central median of 13m
- Edge space of 75 cm between utility corridor and ROW
- Central space at interchange loops

Arboriculture for the project includes:

- Turfing with sods central median to provide aesthetic look and to prevent soil erosion
- Shrubs all along the central median at ends of median to sufficient height to prevent night glares.
- Turfing with sods between ROW and utility corridor.

7.6 Lighting

Illumination for the project road comprises provision of lighting facilities at following locations:

- All along service road
- Toll Plaza approaches
- Roof of vehicular underpass
- Toll Plaza canopy
- High mast lighting proposed at toll plazas, Rest areas, flyovers and ROB

Illumination level proposed by 40 Lux at all locations and 100 lux for toll roof.

7.7 Footpath

Raised footpath is proposed at edge of service road for pedestrian movement. Footpath is a part of utility corridor with utilities laid below the footpath. Footpath is proposed with interlocking cement concrete paving block of M40 concrete laid over 50mm sand bed. The top surface of footpath will be flush with kerb edge.

7.8 Utility Ducts

Utility ducts are proposed across ROW at every 1 Km interval for taking out utility lines. Ducts with 600mm diameter NP4 pipes are proposed. These ducts will be provided with chamber on both sides of utility corridor.

In addition, BWSSB has sought provision of box type of structure connecting utility corridor for taking water supply lines. These are provided at every 1 Km interval. Size of 2m x 2m is proposed.

SECTION – 8

ITS DEVELOPMENT PLAN

(Details as obtained by DULT in 2015)

8 ITS DEVELOPMENT PLAN – CITY ITS

8.1 Introduction

Karnataka is one of the southern states of India with 38.57 per cent of population living in urban areas. In the last 5 years, the state recorded an increase in urban population of more than 31%. Bengaluru, a capital city of the state, alone accounts for almost 11 per cent of the urban population in the state.

Rapid growth of urban population and economic activities in the city of Bengaluru, coupled with increasing vehicle population, necessitates efficient transport and traffic management. As per the CTTS report published by BMRDA (Bengaluru Metropolitan Development Authority), increasing vehicle population results serious delay of travel, loss of productivity, environment deterioration and increasing road accidents. It is expected that vehicle population in the city will be approximately 17.81 million by 2031. This may result estimated 16.5 million daily vehicle trips in 2031, which will be approximately two times the current traffic volume. Being a hub of major industries such as IT, Automobile, Pharma and Aerospace, urban growth will have immense impact on the economy of the city. With these circumstances, it is necessary to explore ways to mitigate the situation by efficiently utilizing the urban transport and traffic infrastructure to meet the increasing traffic demand.

Intelligent Transport Systems (ITS) have been used in advanced countries to improve performance of the existing infrastructure and transport system for better safety, efficiency, comfort and reducing adverse environmental effects. ITS comprises a wide range of information and communication technologies and is applied in the field of transport to improve road/traffic management and enhance convenience of users, thereby maximizing the existing road capacity.

8.2 City ITS for Bengaluru

ITS for Bengaluru city aims to achieve the following objectives:

- To quantitatively comprehend traffic conditions in the city by collecting real time road traffic data,
- To analyse collected traffic data and generate real time congestion information,
- To analyse collected traffic data for planning evaluation of road and traffic management,
- To provide traffic information to road users in real time,
- To share analysed result with relevant authorities,
- To guide road users to alternate route to destination, and
- To utilise accumulated quantitative traffic data for planning and evaluation of road and traffic measures.

8.3 Necessity of City ITS for Bengaluru

Presently, Bengaluru Traffic Police have a Traffic Management Centre and are monitoring traffic by CCTV. However CCTV does not obtain quantitative data. The quantitative data can be utilised to identify traffic conditions and future planning. VMS are installed at several locations but the displayed information is limited to simple static warning messages. Provision of dynamic traffic information requires quantitative data.

Development of road transport infrastructure is underway such as metro construction, flyover development, etc. However road traffic demand still remains high.

Considering current condition in Bengaluru, the following measures are required.

- To provide dynamic traffic information to users to guide the traffic,
- To utilise quantitative data for planning and evaluation,
- To properly control traffic flow in the city,
- To enhance users' convenience, and
- To shift road traffic demand to public transport.

In order to realise the above measures by ITS, the following ITS components are planned in Bengaluru:

- ✓ Bengaluru Traffic Information Centre (B-TIC)
- ✓ Probe System
- ✓ Vehicle Detector System
- ✓ Automatic Traffic Counter-Cum-Classifier (ATCC) System
- ✓ Closed Circuit Television (CCTV) System
- ✓ Variable Message Sign (VMS) System
- ✓ Internet server/SMS System
- ✓ Advanced Signal System
- ✓ Electronic Road Pricing
- ✓ Common Smart Card

8.4 Bengaluru Traffic Information Centre

Bengaluru Traffic Information Centre (B-TIC) will be established as a central control centre to collect traffic data, analyse the collected data, generate congestion information and analytic result, disseminate to road users and share with relevant authorities with the following objectives (ref Figure 8-1).

- To collect, manage and integrate all data related to road and traffic conditions, incidents, weather condition and other necessary data through roadside equipment, probe vehicle and related agencies,

- To process, store, record and analyse the necessary data for planning and evaluation of road and traffic management, and share with relevant authorities,
- To provide information on traffic to road users in order to take notice of traffic/road conditions to possibly choose to detour away from the congested area or hazardous area,
- To monitor the above collected and processed information on realtime basis, and share the information with planning agencies, road administrators and traffic police,
- To operate the ERP and change the display and monitoring hours when necessary,
- To collect the parking information and display parking availability information in the city, and
- To monitor and manage sub-system components.

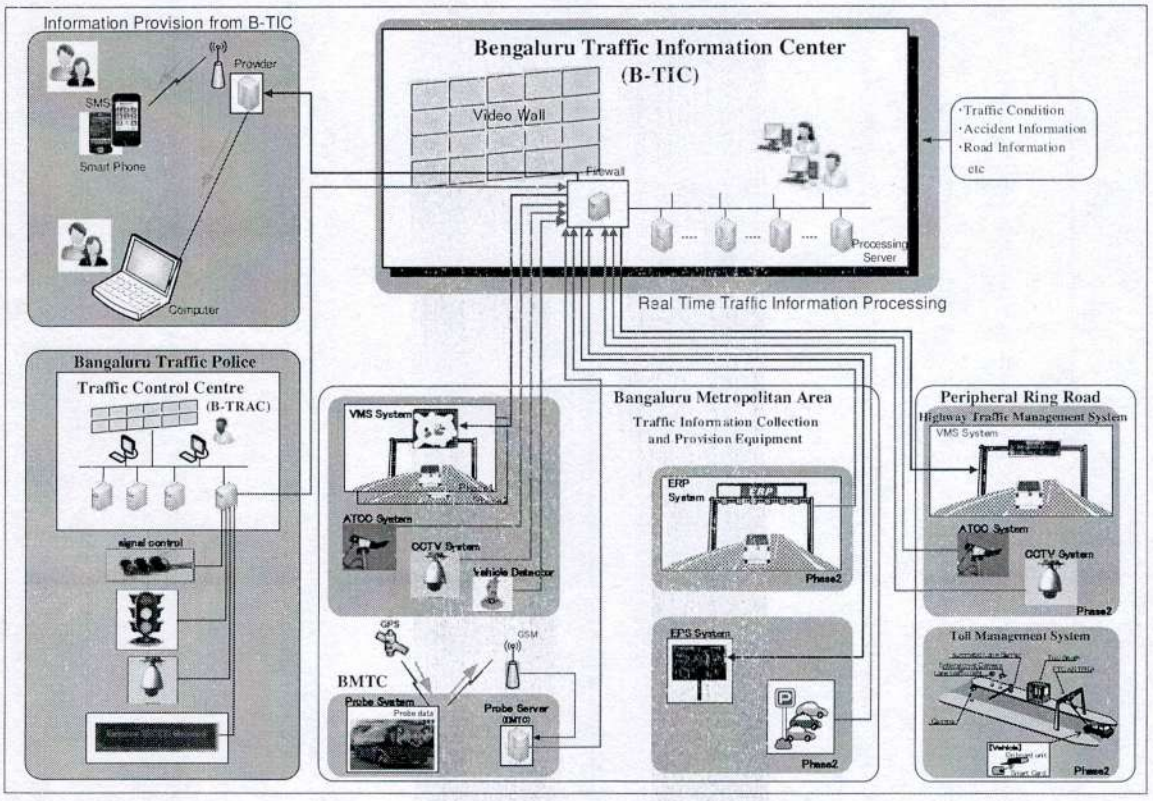

Figure 8-1: Overall system of the B-TIC and related agencies

8.5 Probe System

8.5.1 Purpose

Probe system collects vehicle tracking information dynamically. A probe device installed in a vehicle consists of Global Positioning System (GPS) unit, processor unit, communication unit and power supply unit.

The probe device periodically sends realtime traffic data such as vehicle position and recorded time to the central system. The probe data collected periodically at the centre is analysed to dynamically generate travel time and travel speed on the road network of digital road map. The analysed data is converted into traffic congestion information and provided to road users. Historical probe data is also used for traffic management and urban development planning. An example of congestion on the road network identified by probe car system is shown in Figure 8-2.

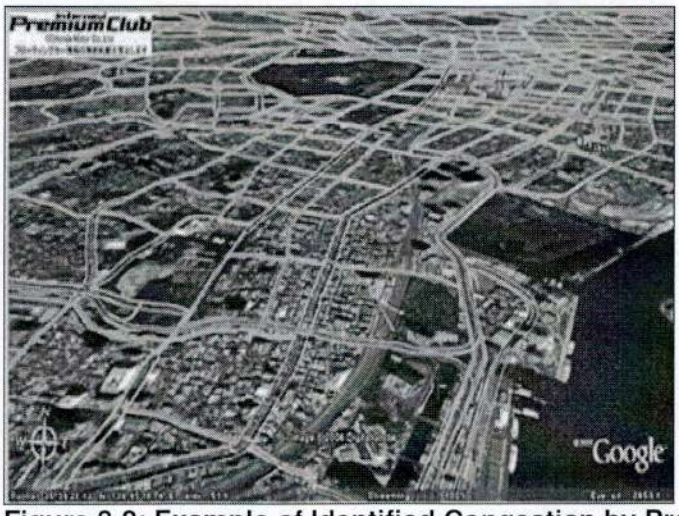

Figure 8-2: Example of Identified Congestion by Probe Car System

8.5.2 Deployment Policy

Currently, Karnataka State Tourism Development Corporation (KSTDC) is using GPS system for tracking their taxis and dispatching them to customers. GPS have been installed on around 500 KSTDC taxis in Bengaluru City.

Bengaluru Metropolitan Transport Corporation (BMTC) has a plan to deploy GPS on 6,700 city buses as part of their Vehicle Tracking and Passenger Information system. The project is currently in progress and is expected to be completed by December, 2014.

B-TIC will use the probe data obtained from KSTDC taxies and BMTC buses. The probe data will be collected by their centres from vehicles, and will be transmitted to B-TIC.

8.6 Queue Length Measurement System

8.6.1 Purpose

A queue length measurement system using vehicle detector will be installed for supplemental purpose for the probe car system.

Probe data provides traffic status of road by sections. However, availability of such data depends on the location of probe cars and there would be no probe car at the section where congestion is frequent. Vehicle detector will be installed upstream of intersection or congestion point. It measures occupancy rate, which is a parameter to judge the congestion level, and determine whether queue has extended to the detector location or not. There are several kinds of vehicle detectors. Amongst them, ultrasonic type is most suitable because of reasonable cost and ease of maintenance compared with other types (ref Figure 8-3).

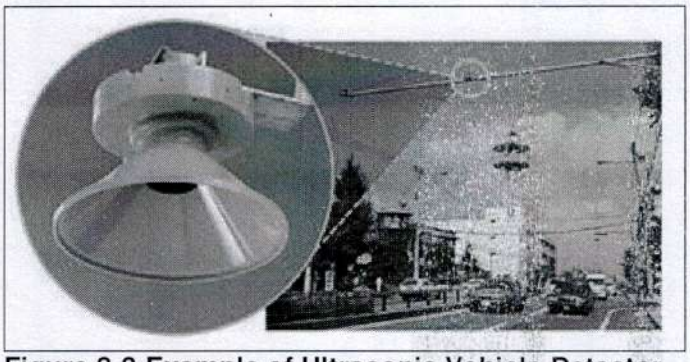

Figure 8-3 Example of Ultrasonic Vehicle Detector

8.6.2 Deployment Policy

Since vehicle detectors judge queue length by vehicle occupancy rate from bottleneck point (normally intersection), they will be installed at several points from the stop line of intersection, normally 300 m, 600 m and 900 m in principle as shown below. Considering condition of road infrastructure in Bengaluru, this principle may not be simply applied at all locations. In such case, adjustment will be made as necessary (ref Figure 8-4).

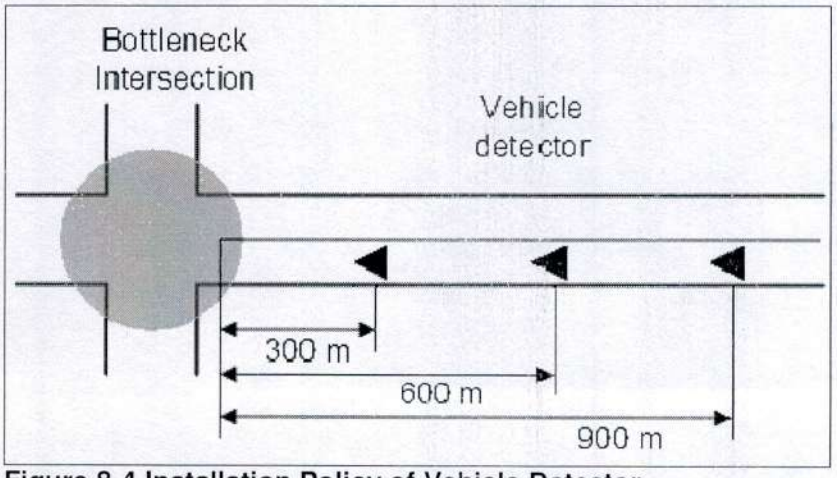

Figure 8-4 Installation Policy of Vehicle Detector

8.7 Automatic Traffic Counter-cum-Classifier (ATCC) System

8.7.1 Purpose

ATCC system will be installed to measure traffic volume classified into large and small sizes. This is for the purpose of utilising the measured data for road and traffic management such as planning/evaluation of new road construction, road widening, etc.

There are mainly four different types of ATCC, namely:

- ultra-sonic type,
- loop-coil type,
- image processing type, and
- infrared type.

Due to absence of lane-keeping discipline and roughness of road surface in Bengaluru, the image processing type will be adopted. The example of image processing is shown in Figure 8-5.

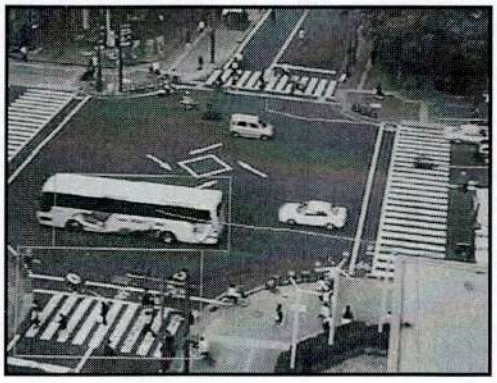

Figure 8-5 Example of Image Processing

8.7.2 Deployment Policy

Installation points of ATCC will be on mid-point between major intersections of trunk roads i.e. National Highway, State Highway, ORR, IRR and other major roads to cover the traffic volume by road section. The location plan is shown in Figure 8-6.

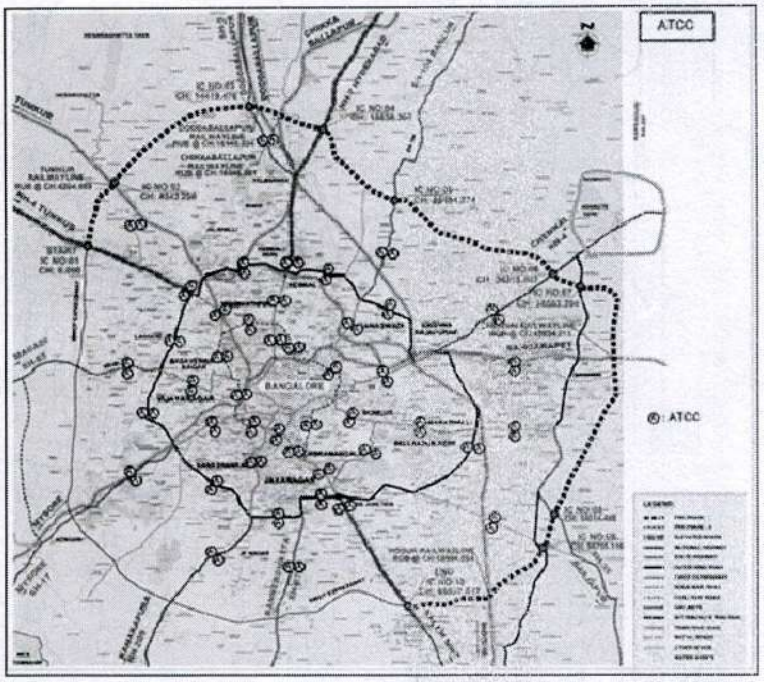

Figure 8-6 Location Plan of ATCC

8.8 CCTV Camera System

8.8.1 Purpose

The purpose of CCTV camera system is to monitor the present traffic, road and weather conditions at accident-prone spots. CCTV camera will have functions of pan, tilt and zooming to capture clear image of vehicles and license plate, if necessary. These captured images will be stored for a certain period and provided to the concerned agencies to develop traffic management measures.

8.8.2 Deployment Policy

CCTV cameras are already installed at intersections in the city and monitored by Traffic Police. Therefore, CCTV cameras will be installed at other accident-prone locations. They are merging points of grade separation and ground level of major roads. In addition to accidents, these locations tend to be a bottleneck of traffic congestion because of merging and diverting activities .

In addition, video link will be prepared between B-TIC and B-TRAC to share moving image of CCTV collected by Traffic Police.

Typical location of CCTV to be installed and location plan are shown in Figure 8-7 and Figure 8-8.

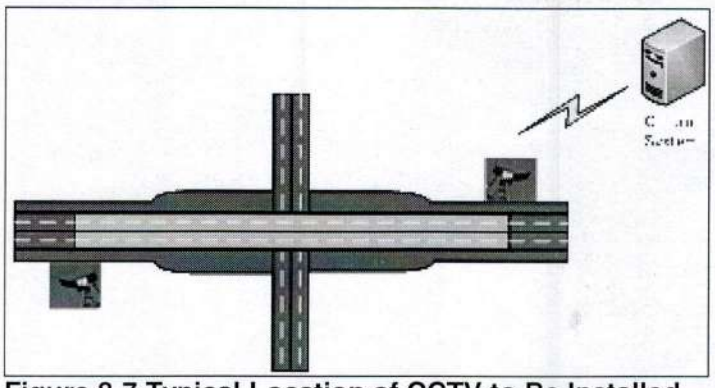

Figure 8-7 Typical Location of CCTV to Be Installed

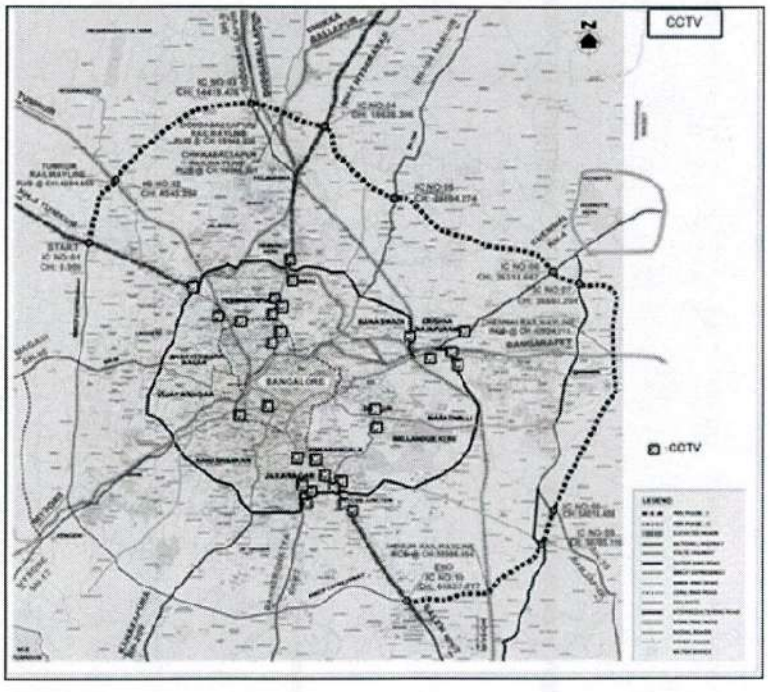

Figure 8-8 Location Plan of CCTV

8.9 Variable Message Sign (VMS) System

8.9.1 Purpose

The purpose of VMS system is to provide information on road, traffic and weather conditions to drivers on the road. VMS is one of the most effective methods for information provision because the information can be provided to all road users on the road even when the vehicle and driver do not possess devices to access the information such as navigation unit, smart phone, etc.

There are several different types of VMS such as text type, graphic type, etc. The graphic type VMS with multi-display and multi-colour is planned to be installed because it is easier to understand the road/traffic congestion by image without much reading. It is also able to

display other information such as incidents and/or time to destination. Thus, drivers can promptly decide whether to take alternative route or not.

Examples of different types of VMS are shown in Table 8-1.

Table 8-1: Various Types of VMS

Type	Image	Function
Text and Symbols		To inform the road, traffic and weather conditions by text and symbols
Travel Time Display		To inform travel time from VMS location to major destinations
Graphic Information Signboard (Multi-colour, multi-display)		To inform about congested sections to allow drivers to select most suitable travel route by using graphic image. Other information such as incidents and/or time to destination can also be displayed.

8.9.2 Deployment Policy

VMS will be installed on radial roads, upstream of major junction of ORR and PRR for vehicles coming into the city so that drivers can recognize traffic/road congestion/condition and choose to avoid the incidents/congestion before entering city centre. Location plan is shown in Figure 8-9.

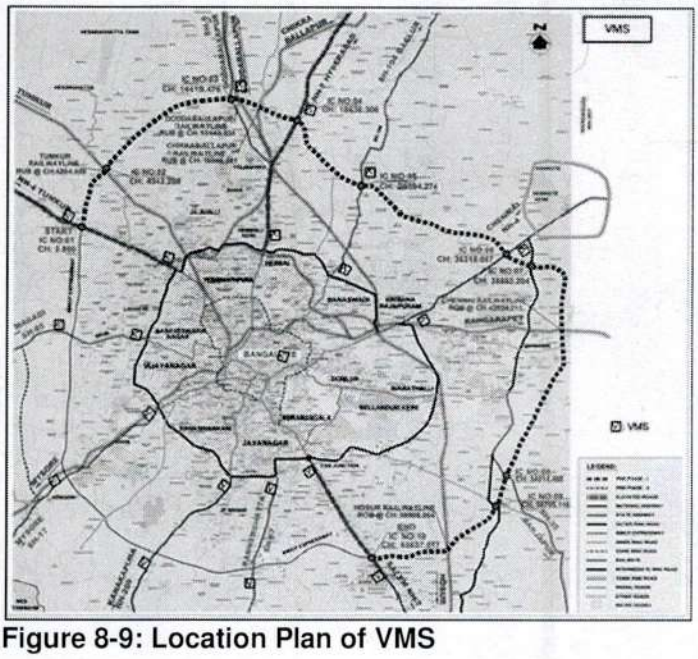

Figure 8-9: Location Plan of VMS

8.10 Advanced Traffic Signal System

Traffic police installed traffic signals at around 336 junctions/intersections in the Bengaluru City. The existing signal system does not have vehicle detector to detect vehicle presence or measures traffic volume, speed or occupancy that indicates prevailing traffic condition. Currently, traffic signal timing is modified according to the time of day, or by the traffic constable at the junction or operator at Traffic Management Centre based on the observation of traffic condition through CCTV camera. The signal system does not have coordination function either and signals operate independently without coordination.

Area traffic signal control system will be upgraded and signal timing will be automatically adjusted based on the prevailing traffic condition gathered by the vehicle detector and in coordination with other signals in the area.

Vehicle detectors are placed at various locations in the road network to collect traffic condition data. Vehicle detector data is sent to the Control Centre for processing and analysis. Based on detector data, optimum signal timing parameter (a combination of cycle, split and offset) is then prepared for each signal. As the signals are controlled from the centre, coordination among the signals are maintained. This type of signal system is shown in Figure 8-10.

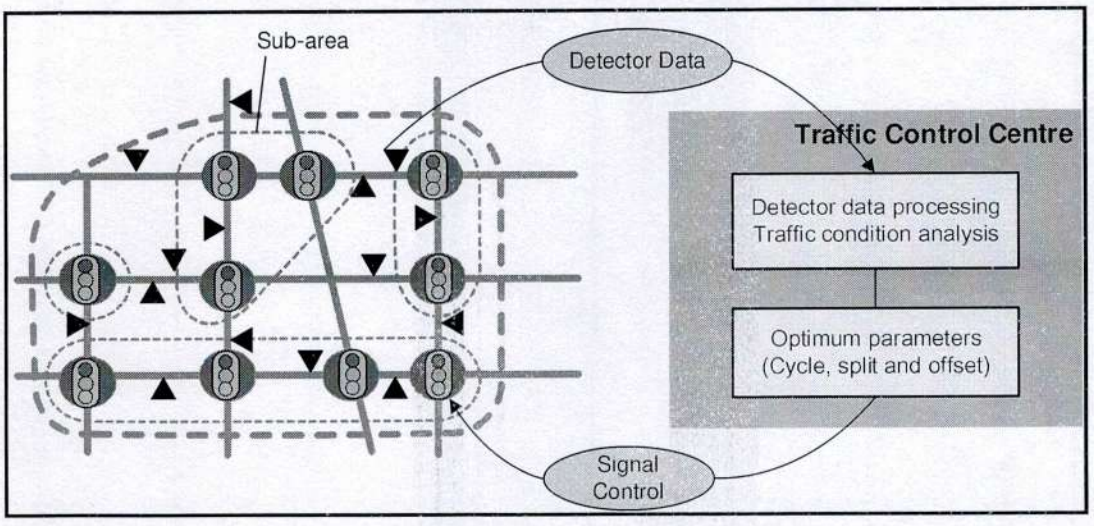

Figure 8-10: New Centre Signal System

System upgrade will be made in three phases. The reason is that the number of signals is too large to implement upgrade at one time. If upgrade work is done at one time, it will take too long and during the work, the system is continuously modified.

In phase 1 project, the control centre system, in particular, software will be modified and new modules such as detector data processing, signal timing calculation and real-time signal control will be added. In addition, 100 signals in the core area of the city (green area in the map below) will be upgraded together with installation of vehicle detector.

In phase 2, the area will be expanded to the Outer Ring Road and another 180 signals (blue area in the figure below) will be upgraded to the new system. In phase 3, signals beyond Outer Ring Road will be upgraded. The area covered by each phase is shown in Figure 8-11.

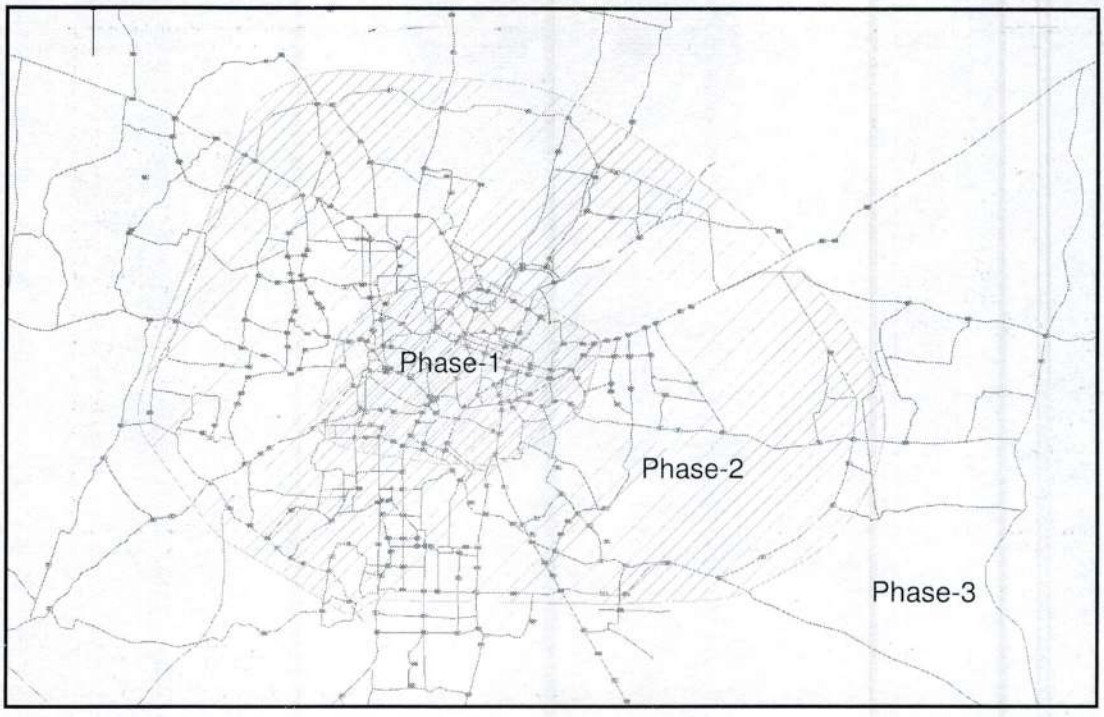

Figure 8-11: System Upgrading in Phase

8.11 Common Smart Card

Nowadays, dissemination of IC (Integrated Circuit) card, also known as smart card, is rapidly increasing and replacing for magnetic card in various fields such as finance, retail, medical, education and transportation because of drastic improvement of convenience by using it.

Smart card is also used as a common mobility card. Because a single smart card makes it easy to travel across different transport such as trains and buses just by touching the card to the reader at the ticket gate or on board buses. Thus the common smart card is increasingly becoming a standard mode of fare payment and retail payments at transport, kiosks and retail shops. The advantages of the common smart card for fare payment are as follows;

- Fast payment processing at entry/exit gate of transportation modes
- Sufficient memory for saving inter-modal travel records
- Flexible payment such as discounts
- Possible to change from zoning or fixed fare collection to distance-based fare collection
- Possible to transfer modes without cash preparation
- Avoiding queue waits for purchasing tickets

Furthermore, it helps transport operators to minimize the leakage of fare collection.

8.11.1 Current Situation of Smart Card & Necessity of Common Card in B'lore

There are two major public transport operators in Bengaluru. They are metro rail and city bus. The metro rail is operated by Bengaluru Metro Rail Corporation Limited (BMRCL).Currently phase I of the metro rail project is under construction and part of it is already in operation. The city bus is operated by Bengaluru Metro Transport Corporation (BMTC). They operate approximately 6,700 buses in the city.

BMRCL has introduced a smart card called "Namma Metro" card for metro rail passengers. BMTC is also planning to introduce smart card for city bus passengers.

In the future, it is expected that a variety of public transport systems, besides metro and bus, such as LRT, BRT and Monorail will be in place in Bengaluru. Further, It is also planned to introduce smart card payment for both Touch & Go and ETC lanes on Peripheral Ring Road.

In such situation, it is necessary to introduce a common smart card which can be used for a variety of services and establish a scheme which allows different players to participate.

8.11.2 Common Card and Clearing House for Bengaluru

The common card and clearing house are planned as follows:

- Introduction of common card for electronic payment for all transport modes, parking, toll collection, congestion pricing, retail shops, etc.
- Establishment of a central clearing house for all transaction clearance and settlement among different cards issuers, transport operators and other related agencies.

The planned central clearing house and relevant services are depicted in Figure 8-12.

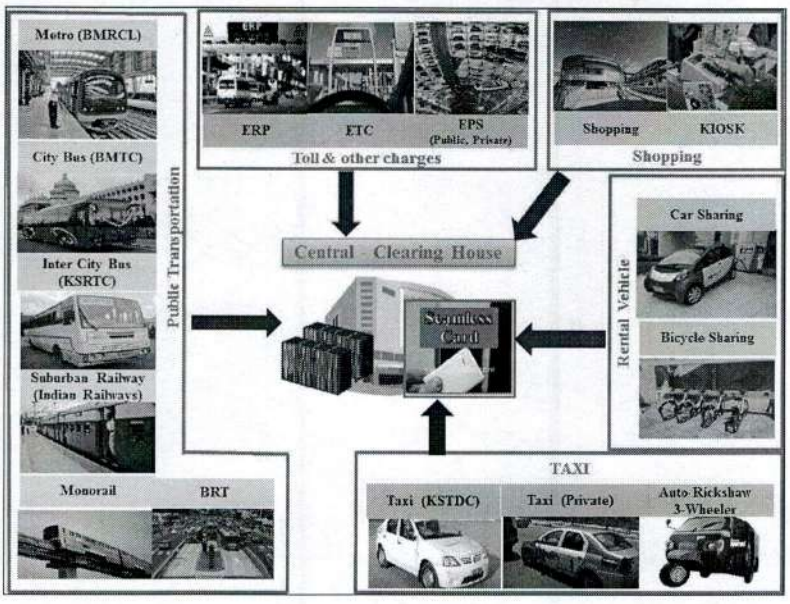

Figure 8-12: Planned Clearing House and Relevant Services

8.12 Congestion Pricing in Bengaluru

Traffic demand management has been implemented in the cities in developed countries to discourage people using congestion routes during peak hours. These measures encourage people to shift from personal vehicles to public transport if they need to travel to congestion areas. Successful examples of road pricing include cities such as London and Singapore.

Development of mass transit and public transport cannot alone sufficiently enhance use of public transport, regulate use of personal vehicles nor reduce congestion on roads. In the case of Delhi, despite extensive metro coverage, number of personal vehicles and congestion levels on road has been on rise. Improvement of public transport and enhancement of its accessibility needs to be coupled with traffic demand management.

Congestion pricing is one of the traffic demand management measures. Introduction of the congestion pricing, using ITS technology which is called 'electronic road pricing (ERP)', is planned in Bengaluru. It will be implemented in a phased manner. Initially, it will be introduced on the congested roads to foster road users' understanding as to effectiveness of ERP. Based on lesson learnt from the initial implementation, further expansion onto area based congestion pricing will be carried out.

8.13 PRR ITS

8.13.1 Introduction

The Peripheral Ring Road (PRR) is a semicircle road surrounding Bengaluru at a distance of 17 km to 25 km from the city centre. It starts at the intersection with National Highway 4

(Tumkur Road) in Madavara located at north-east of the city and ends at Konappana Agrahara connecting with Hosur Road at south-east part of the city passing through northern and eastern parts of the city. NICE road is another semicircle road with which PRR connects at both ends to form a full circle ring road around Bengaluru.

The PRR is a fully access controlled toll road and interchange will be constructed at ten (10) locations including connecting with radial roads, and with NICE also at both ends.

The proposal presented in this section is indicative and will be reviewed by BDA based on overall toll operation and traffic management system with other stake holders, if required.

ITS for PRR is composed of the following two components:

- Toll Management System: TMS
- Highway Traffic Management System: HTMS

8.14 Toll Management System: TMS, Basic Policy

8.14.1 Toll Structure

A closed type toll management system (TMS) will be introduced to the PRR and drivers will be charged with a toll corresponding with the distance travelled. Tolls will be collected from all motorized vehicles using the PRR except special vehicles such as VIP cars, emergency services, military convoys and other exemptions.

8.14.2 Toll Collection Method

Three types of toll collection method will be adopted; Electronic Toll Collection (ETC), Touch and Go (TnG), and manual.

The ETC automatically processes toll collection and allows vehicle to pass without stopping at both entering and exist toll gates. The automatic transaction is realised by communication between antenna installed at toll gate and on-board unit (OBU) equipped inside vehicle. A 2-piece type OBU will be introduced.

The Touch and Go (TnG) deducts toll amount from a contactless smart card when the user touches the card readers installed at toll booth. ETC and TnG will use prepaid payment system and the same contactless IC card (smart card) will be interchangeably used for ETC and TnG.

The ETC equipment will be installed at dedicated lanes for non-stop ETC. Both manual and TnG will be equipped at all other lanes.

8.14.3 Vehicle classification and toll amount

Vehicles will be classified into at least five (5) types as listed in Table 8-2. The vehicle classifications proposed hereunder make it possible to classify vehicles with suitable type of equipment that measures number of axles and vehicle height. All software, display formats and print-outs will be designed to cater for these five classifications.

Table 8-2: Vehicle Classification for Toll amount

Class	Type
1	Car, Jeep, Van or Light motor vehicle
2	Light commercial vehicle, Light good vehicle, or Mini bus
3	Truck or bus
4	Multi-axle vehicle (3 to 6 axles)
5	Oversized vehicle (7 or more axles)

8.14.4 Cards used with the System

The contactless smart card complying with the ISO/IEC 14443 Type A standard will be used as:

- Ticketing media (Transit Card) for manual collection
- Prepaid card to be used with ETC and Touch & Go; and
- Identity cards for the staff of PRR, toll management system operator and other relevant organizations.

The contactless smart card will have compatibility with the common card which will be introduced for other transport mode in the city and retail shops. Figure 8-13 to Figure 8-16 shows examples of ETC gate, 2-piece type OBU and Touch and Go booth.

Figure 8-13: ETC Gate in Japan

Figure 8-14: 2-piece Type OBU

Figure 8-15: Card Inserted OBU fixed on Windscreen

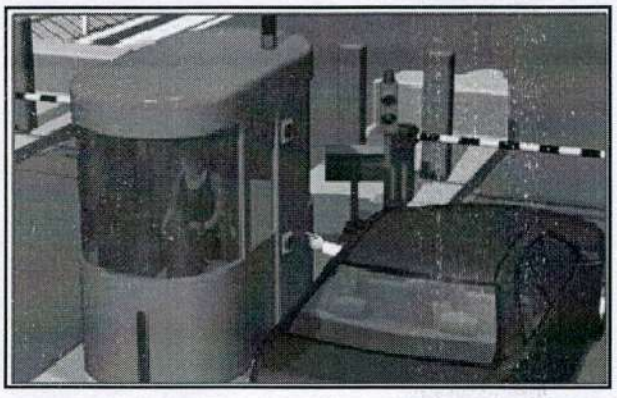

Figure 8-16: Image of Touch and Go Booth

8.15 System Configuration

Toll management system comprises various equipment at three levels. They are toll lane equipment, plaza computer system and toll management centre (TMC) system.

A set of toll lane equipment will be installed in the tollbooth, on the toll island or its vicinity for toll collection operation. The operation of all lane equipment will be monitored continuously by a plaza computer system that will compile; audit and prepare the statistical data for print out, for display in the Plaza building control room or onward transmission to Toll Management Centre (TMC)

A Toll Management Centre (TMC) will be constructed at one of the interchanges along PRR. The centre system will have duplex system configuration with a standby server system that takes over the operation in case of stoppage of main server.

The Plaza Computer System (PCS) will also provide management functions such as attendance recording, reconciliation between declared and expected toll collection and control of cash transferred from the plaza to the bank.

Each plaza will operate as an autonomous system with no real-time data communication between plazas and between plaza and Toll Management Centre (TMC). Thus, interruption of data communication link will cause minimum effect on the continuous toll management system operation. A data communication network via fibre optical cable will be provided. A complete data communication link from the toll lane controller to the PCS and between PCS and TMC system and all the necessary interfaces to this data communication network will be provided.

8.16 Toll Lane Equipment

Various equipment will be installed at toll lane either inside toll booth or on and around island. They are summarized in Table 8-3.

Table 8-3: Various Equipment Proposed to be installed

	Equipment	Purpose
Inside Tollbooth	Toll Lane Controller (TLC)	It controls and monitors all toll lane equipment. It also stores transaction data and other data necessary for toll collection operation.
	Toll Collector Terminal (TCT) without receipt printer (RPR)	It is an interface equipment for toll collector, with display and keyboard. Receipt printer issues receipt.
	Smart card reader/writer (SCRW)	It reads or writes data from or to smart card used as transit card and TnG card.
	Emergency footswitch (FSW)	It initiates an alarm at toll plaza office in case of emergency.

	Equipment	Purpose
	Intercom slave communication unit (ISCU)	It is used as verbal communication unit between toll operator and staff in the toll plaza building.
Toll lane or island	Manual lane barrier (MLB)	It is a barrier for manual lane.
	Overhead traffic light (OHTL)	It indicates whether a toll lane is open or closed.
	Lane traffic light (LTL)	It indicates whether a vehicle stopped at tollbooth is allowed to proceed or not.
	ETC antenna	It communicates with on-board unit (OBU) installed inside vehicle and exchange data for ETC transaction.
	User fare display (UFD)	It indicates amount of toll deducted or balance in the card, and other information as necessary.
	Automatic lane barrier (ALB)	It controls vehicle movement at toll gate, normally stays at closed position and opens when a vehicle is allowed to pass.
	Amber siren beacon (ASB)	It is activated by toll collector and indicates emergency.
	Incident capture camera	It takes an image of vehicle on the toll lane.
	Automatic vehicle classifier system (AVC)	It determines vehicle class based on the physical features of vehicle measured by the system and determines the amount to be charged.

8.17 Plaza Computer System

A plaza computer system (PCS) will be provided in each interchange plaza building control room. The PCS will have two main functions:

- Data acquisition from lane equipment and provision of real time monitoring facilities via visual display unit in the control room of the plaza building.
- Data processing and plaza management via visual display units, printer terminals and data transfer facilities.

The PCS will comprise various inter-linked software modules, some of which will carry out real time functions, such as data communication with lane equipment and provision of detailed monitoring facilities.

8.18 Toll Management Centre System

The TMC system will have the following main functions:

- Data acquisition from PCS.
- Data processing and validation via visual display units, printer terminals, portable memory modules and data/parameter transfer facilities.
- Downloading of operational parameters to PCS.

The TMC system will be connected to PCS by wide area network over optical fibre cable network. The TMC system will make available operating parameters relating to plaza operations for transfer to the PCS and will receive data files from the PCS.

8.19 Software

A set of software will be composed of application for operation of the servers, workstations and computers of lane computer system, Plaza Computer system, Toll Management Centre system and other computers.

The set of the software will consist of those provided by third party and those specifically developed for the project. All third party software will be legally licensed and there will be no restriction on the use in the toll management system.

8.20 Network Equipment

Network equipment will be installed at each interchange toll plaza building to connect plaza computer system with toll lane system and Toll Management System with plaza computer systems.

The network between the Toll Management Centre system and toll plaza system will use the optical fibre cable network along the PRR and a data communication network will be established using Layer 3 Switch.

8.21 Power Supply

Power supply rated at 440V, 3 phases will be made available at the Essential Supply Board of the Interchange Toll Plaza Building. This supply will be backed up by standby generators.

UPS systems will be installed at each interchange location and TMC. All plaza computer system and all lane equipment will be provided power through this UPS to make sure that the power is continuously available to all Toll Management System Equipment during the interruption of commercial power.

8.22 CCTV System

A CCTV system will be introduced as part of toll management system. The CCTV equipment is categorized as two types, CCTV for Toll Systems and CCTV for Security.

The CCTV for toll systems will consist of:

- Toll Booth CCTV Cameras
- Plaza Surveillance CCTV cameras
- Plaza Building Security CCTV cameras

8.23 Highway Traffic Management System: HTMS

8.23.1 Overview

The Highway Traffic Management System (HTMS) is a system that helps the operator of the Peripheral Ring Road (PRR) to safely and efficiently manage the traffic on the PRR. The conceptual system configuration is shown in Figure 8-17. The system consists of three parts of information collection, information processing and surveillance, and information dissemination. In addition, information will be exchanged with other relevant organizations and road users.

Information collection system gathers the traffic, road and weather condition on the PRR through automatic traffic counter-cum-classifier and closed circuit TV (CCTV) installed along the PRR, and through communication systems. The data collected by these devices are sent to the Traffic Control Centre through digital transmission system (ref Figure 8-18).

System operator monitors the conditions of the PRR through the video wall and workstations. Measures are taken in case of incident such as congestion, accident, road or lane closure, and construction work. The conditions of the PRR will be disseminated to PRR users through variable message signs installed on the PRR and also on the roads leading to the PRR, and through Internet. SMS will be sent to the registered users in case of incident. Cooperation with relevant organizations such as Traffic Police, ambulance and wrecker services must be arranged so that coordinated operation can be made in case of incident.

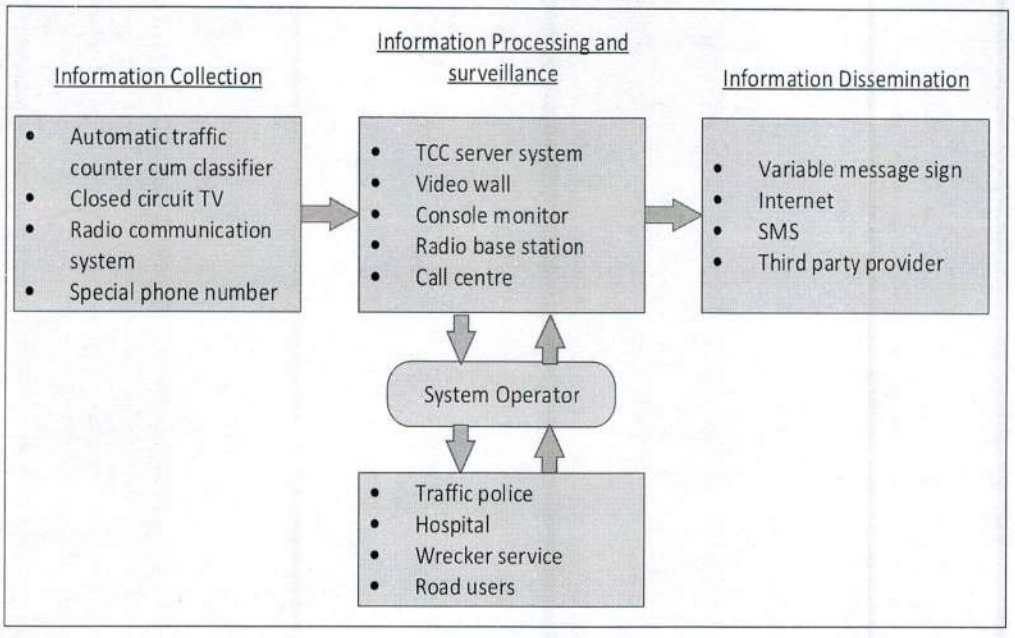

Figure 8-17: Conceptual System Configuration

Figure 8-18: Example of Traffic Control Centre

8.24 Outline of the System

In order to ensure safe and comfortable flow of traffic along its entire stretch of Peripheral Ring Road, a Highway Traffic Management System (HTMS) will be introduced. The system will have a Traffic Control Centre (TCC) at one of the interchanges along PRR to oversee traffic control 24 hours a day, 365 days a year. The centre system will have duplex system configuration with a standby server that takes over the main server in case of the stoppage of the latter.

The Highway Traffic Management System (HTMS) collects road and traffic data and provides this data 24 hours a day, 365 days a year to road users, thereby serving as a traffic management system which ensures safe and smooth traffic flow on the PRR. The HTMS

system comprises traffic as well as facilities for providing this information. The overall system configuration of the HTMS is shown in the Figure 8-19.

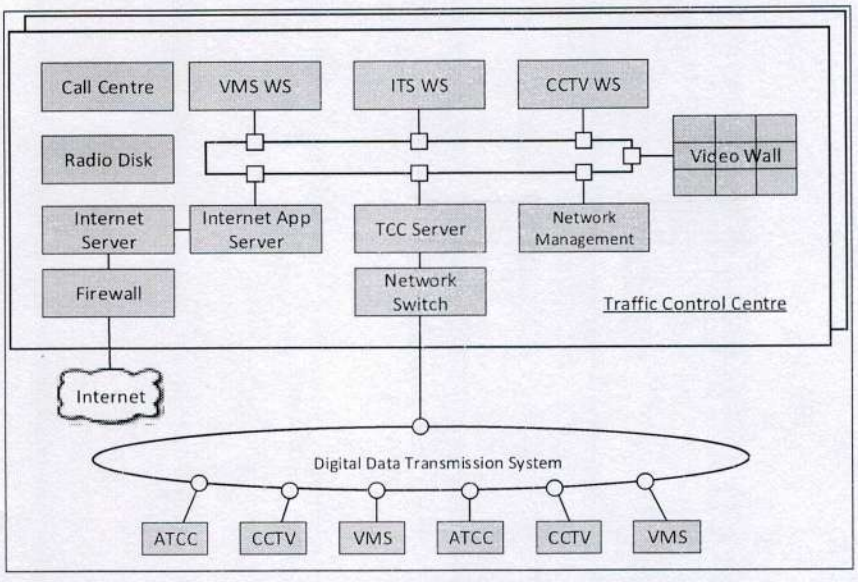

Figure 8-19: Configuration of Highway Traffic Management System

8.25 Features of HTMS

Highway Traffic Management System for the PRR will be designed with the following design concept:

8.25.1 Highly reliable system

As the HTMS plays an important role in the traffic management of the PRR, the system must be highly reliable and operate continuously. Control center provides traffic information 24 hours and 7 days a week.

Data communication system also adopts redundant configuration. Optical fibre cable will be installed on footpaths that are located on both sides of the PRR in ring form so that any interruption of the communication link on one ring can be covered by another ring.

8.25.2 Intensive use of optical fibre cable

The data communication system along the PRR uses optical fibre cable only and no metallic cable will be installed. Optical cable has advantage over metallic cable. It is much lighter and smaller in size so that installation is easier. As it uses light instead of electrical current, it is not susceptible to the lightning and induction caused by high power line. In addition, the optical fibre cable costs less for the same transmission capacity.

8.25.3 Power supply

Various field devices will be deployed along the PRR. All of them require power supply. If power is to be supplied though the power supply cable, its total length will be very large as the cable virtually cover all stretched of the PRR on both side to supply power to VMS, CCTV, and ATCC. However, the interval of every interchange is approximately 5-7 km and toll plaza and tollgate also requires power, since all ITS equipment deployed nearby interchanges, power required for ITS equipment can be supplied from toll plaza buildings.

8.25.4 Use of Video Vehicle Detector

Vehicle detector is the most basic device for a highway traffic management system. It provides vehicle counting data classified into small and large vehicles. Instead of conventional inductive loop vehicle type, which requires maintenance of loop coil embedded in the pavement, video type vehicle detector will be used for ease of maintenance.

8.26 HTMS Components and Functions

8.26.1 Information collection system

The information collection system consists of closed circuit television (CCTV) system and automatic traffic counter cum classifier (ATCC) System. CCTV will be used to monitor the traffic flow. Incident detection function that can detect situational object or object moving reverse direction will be provided to CCTV system (ref Figure 8-20).

Automatic traffic counter cum classifier (ATCC) counts number of vehicles in the sensing area and classifies them into two types, small and large (ref Figure 8-21).

Figure 8-20: CCTV Camera

9.4 Project Cost

The proposed PRR is a green field project. The estimated project civil construction cost is Rs 4869 Crores.

Revenue surveys were completed to substantial portion recently. Assessment of Total cost of land acquisition is in progress.

The above costs does not cover costs towards implementation of ITS for Bengaluru City and PRR. During recent meeting BDA had with JICA on 22-01-2020, JICA suggested BDA to include ITS towards Bengaluru city to be part of the project and be compatible with PRR project. The technical details and costs towards ITS were provided by DULT in 2015 is Rs 800.00 Cr. The Civil Cost indicated above does not include costs of ITS.

9.5 Implementation Plan

The project road of 65 Km is split into 3 sections (ref Table 9-1) so that BDA can take up the construction activity and complete them concurrently. The project road crosses existing National Highways at four locations and hence for the sake of convenience, section break up are drawn at NHs.

Table 9-1: Project Sections for Implementation

Stretch No	Starting	Ending	Length, Km
1	Km 0.000 (Tumkur road)	Km 18.367 (Bellary Road)	18.367
2	Km 18.367 (Bellary Road)	Km 36.323 (Old Madras Road)	17.956
3	Km 36.323 (Old Madras Road)	Km 65.115 (Hosur Road)	28.790

BDA proposes the project to be taken up on Item Rate Contract with Good For Construction Drawings made available to the contractor during construction. The total time frame required for construction of all civil works including toll plaza will be between 30 months – 36 months depending on the section and 18 months is set aside for implementation of Intelligent Transport System (ITS) for the project as a whole. In addition, it is a period of 12 months for implementation of other ITS components is estimated. It is expected that BDA hands over construction land free of encumbrances to an extent that sufficient front is available to contractor. The contractor is expected to carry out required field surveys and investigations, carry out designs and prepare "For Approval" drawings and get it approved by BDA

Item	Car	LCV	Mini Bus	Bus	2-Axle Truck	3-Axle Truck	Multi Axle Truck
Vehicle Price Rs.	4,14,320	6,33,500	8,50,000	10,70,005	11,08,216	12,49,971	14,59,937
No. of Wheels	4	4	4	6	6	10	18
No. of Axles	2	2	2	2	2	3	5
Passengers	4	-	20	50	-	-	-
Tyre Price Rs.	2,864	4,482	9,683	9,683	9,082	9,082	9,082
Fuel Per/Lt. Rs.	28	27	27	27	27	27	27
Lubricating Oil (Rs)	84	84	84	84	84	84	84
Maint. Labor (per hr.) Rs.	62	116	127	127	139	136	136
Crew Wages (Rs./ hr)	32	36	87	87	139	139	139
Annual Overhead (Rs.)	23253	13323	100000	156601	32701	60730	60730
Interest Rate (%)	12	12	12	12	12	12	12
PCSE	1	1.3	1.3	2	2	2	2.2
Working Hours	1,950	1,500	850	2,200	2,100	2,100	2,100
Annual km	32,000	60,000	34000	1,00,000	75,000	75,000	75,000
Avg. life (Years)	10	8	8	8	8	8	8

- Rise and Fall – 2.5, -1.2 & 0.8 m/Km for 3 sections respectively
- No. of Rise and Falls – 2 / Km for all sections
- Average curvature – 10.2, 13.0 & 11.6 deg./ Km for 3 sections respectively
- Speed Limit – 45.65 Km/hr for existing roads of Section-1, 26.29 Km/hr for existing roads of Section-2 and 36.51 Km/hr for existing roads of Section-3. For proposed PRR speed limit has been assumed as 65 Km/hr for all sections.
- Sub grade CBR – 8%
- Roughness (IRI) – 1.5 m/km (after periodic maintenance in year 2018) for existing roads and 1.5 m/km for new road

- Total cracking area – 15% for existing roads and 0% for new road
- Total raveling area – 15% for existing roads and 0% for new road
- No of potholes – 10 nos/km for existing roads and 0 nos/km for new road
- Edge break area – 10 sqm/km for existing roads and 0 sqm/km for new road
- Rut depth – 10 mm for existing roads and 0 mm for new road
- Recent Surface thickness assumed for existing roads – 50 mm
- No non–motorized vehicle has been considered in the analysis
- Average altitude – 900 m
- Discount rate – 12%

9.6.5 Alternatives

For the project road, following options are considered:

- Without Project / Do-Nothing scenario: No improvement for 6 lane existing road is proposed, only routine and periodic maintenance are considered. Traffic will continue to use existing road network in absence of Peripheral Ring Road.
- With Project / Improvement scenario: Construction of new 8 lane Peripheral Ring Road (PRR) with routine and periodic maintenance and existing road with routine and periodic maintenance are considered. This consists of two parts:
    - Reduction in VOC for traffic on new PRR (Bypass alignment)
    - Reduction in VOC on existing roads (ORR and interconnecting radial roads)

9.6.6 Project Cost and Maintenance

For the purpose of carrying out the economic analysis, the cost estimate of the road has been prepared considering road, structures and other amenities and facilities separately. The construction is expected to start in 2019 and be completed in the year 2022, construction period being estimated as 36 months.

The total cost of the improvement has been worked out as Rs 4869 crores at current financial prices (excluding land acquisition) for the total length. The distribution of cost has been estimated as 30% in first year, 45% in second and 25% in third year.

The maintenance works considered for all sections of Existing road and proposed PRR are presented in Table 9-7.

8.25.3 Power supply

Various field devices will be deployed along the PRR. All of them require power supply. If power is to be supplied though the power supply cable, its total length will be very large as the cable virtually cover all stretched of the PRR on both side to supply power to VMS, CCTV, and ATCC. However, the interval of every interchange is approximately 5-7 km and toll plaza and tollgate also requires power, since all ITS equipment deployed nearby interchanges, power required for ITS equipment can be supplied from toll plaza buildings.

8.25.4 Use of Video Vehicle Detector

Vehicle detector is the most basic device for a highway traffic management system. It provides vehicle counting data classified into small and large vehicles. Instead of conventional inductive loop vehicle type, which requires maintenance of loop coil embedded in the pavement, video type vehicle detector will be used for ease of maintenance.

8.26 HTMS Components and Functions

8.26.1 Information collection system

The information collection system consists of closed circuit television (CCTV) system and automatic traffic counter cum classifier (ATCC) System. CCTV will be used to monitor the traffic flow. Incident detection function that can detect situational object or object moving reverse direction will be provided to CCTV system (ref Figure 8-20).

Automatic traffic counter cum classifier (ATCC) counts number of vehicles in the sensing area and classifies them into two types, small and large (ref Figure 8-21).

Figure 8-20: CCTV Camera

9 COST ESTIMATE AND IMPLEMENTATION PLAN

9.1 General

Cost estimation is important for the feasibility study as it provides vital input to the economic and financial evaluation of the project. The cost estimates have been prepared for project road in three sections covering all components of works – earthwork, pavement, CD structures, bridges and major structures, road furniture, toll plaza etc. Costs for other items of work which are not directly related to construction, but required for effective project implementation - utility shifting / relocation, designs, surveys, approval, environmental mitigation measures, rehabilitation and resettlement measures are also included.

9.2 Unit Rates

Cost estimates for various items of work are computed using unit rates given in National Highways SR, Bangalore circle 2018-19 for most of the items of work. Unit rates from manufactures / consultants previous experience / KPWD SR for the year 2018-19 are also used for few items of work which are not covered in NH SR. Area weightage of 6% as applicable for Bangalore city is considered.

The Bill of Quantities are worked out based on revised cross section parameters and revised schedule of rates.

9.3 Items of Work

Following items of work are considered in Bill of Quantities and Cost Estimate (NH SR 2018-19):

- Site clearance and Earthwork
- Pavement – flexible and rigid for service road and main road
- Drainage and protective works
- CD structure works
- Major structures – minor bridges, flyovers, underpasses, railway crossing structures,
- Toll Plaza works
- Road appurtenances – signage, road markings, crash barrier, delineators, kerbs etc
- Miscellaneous – lighting, landscaping,
- Maintenance – regular and periodic

8.25.3 Power supply

Various field devices will be deployed along the PRR. All of them require power supply. If power is to be supplied though the power supply cable, its total length will be very large as the cable virtually cover all stretched of the PRR on both side to supply power to VMS, CCTV, and ATCC. However, the interval of every interchange is approximately 5-7 km and toll plaza and tollgate also requires power, since all ITS equipment deployed nearby interchanges, power required for ITS equipment can be supplied from toll plaza buildings.

8.25.4 Use of Video Vehicle Detector

Vehicle detector is the most basic device for a highway traffic management system. It provides vehicle counting data classified into small and large vehicles. Instead of conventional inductive loop vehicle type, which requires maintenance of loop coil embedded in the pavement, video type vehicle detector will be used for ease of maintenance.

8.26 HTMS Components and Functions

8.26.1 Information collection system

The information collection system consists of closed circuit television (CCTV) system and automatic traffic counter cum classifier (ATCC) System. CCTV will be used to monitor the traffic flow. Incident detection function that can detect situational object or object moving reverse direction will be provided to CCTV system (ref Figure 8-20).

Automatic traffic counter cum classifier (ATCC) counts number of vehicles in the sensing area and classifies them into two types, small and large (ref Figure 8-21).

Figure 8-20: CCTV Camera

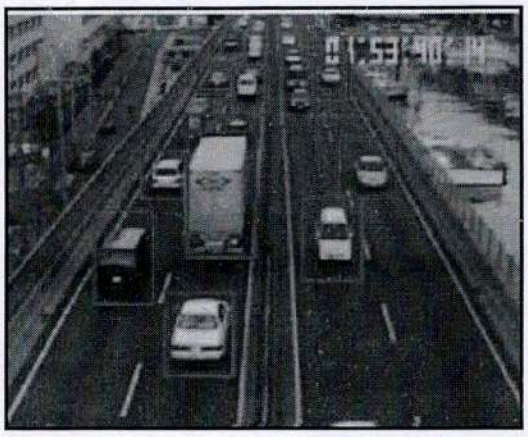

Figure 8-21: Image taken by ATCC

Emergency call box will not be installed on PRR as proliferation of mobile phone made it possible for drivers to contact the Traffic Control Centre or other party. A call centre will be established and special phone number will be assigned to it.

Meteorological data station will not be introduced either, as Bengaluru seldom encounters adverse weather condition that affects driving safety.

Radio communication system will be installed for PRR and possibly for traffic management system. A base station will be constructed at Traffic Control Centre and satellite station or repeater station will be constructed to cover entire stretch of PRR. Necessity and location of satellite station or repeater station will be determined by conducting propagation test. Mobile unit for vehicle and handy walkie-talkie for staff will be used.

8.26.2 Information processing at centre

Traffic flow data collected by ATCC are processed at the Centre into the form suitable for statistical application. During the process, any abnormality, either caused by incidental traffic condition or equipment malfunction, is detected by the processing software and warning is issued for operator's attention.

Image from CCTV camera is normally used for observation by the operator. At the same time, image is recorded by the digital video recorder. In case abnormality is found by the system, a warning is also issued.

All calls to the call centre and conversation over radio communication system will be automatically recorded for reviewing in the future.

8.26.3 Information dissemination

Traffic and other information will be disseminated to the road users through variable message sign. They will be installed at and around interchange. It provides information regarding the road and traffic condition at the downstream section so that drivers can take appropriate action including diverting to detour, or prepared for the incident (ref Figure 8-22).

Figure 8-22: Variable Message Sign (simulated image)

Traffic information will also be disseminated through Internet in various formats. Congestion map showing congested locations, incident location or construction site will be prepared for access by the road users (ref Figure 8-23).

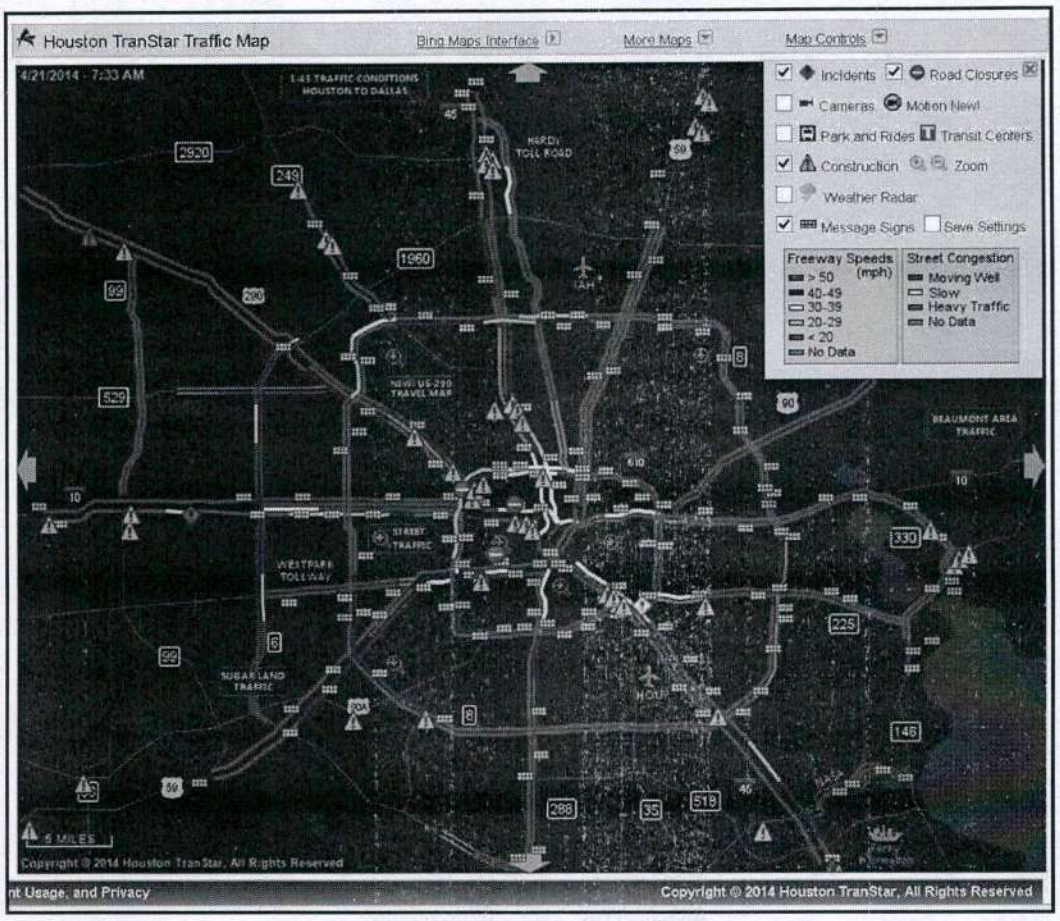

Figure 8-23: Ex. of Traffic Map (Houston:http://traffic.houstontranstar.org/layers/)

Traffic alert e-mail or SMS will be prepared. When there is incident, construction work, road closure, or other event that hampers normal traffic, e-mail of short message will be sent to the registered subscribers.

8.26.4 Digital Data Transmission System

Roadside equipment installed along the PRR will be connected to the Traffic Control Centre through digital data transmission system using optical fibre cable. Optical fibre cable will be installed along the PRR inside utility ducts to be installed along service road. Branching of fibre cable will be made to extend the cable to the equipment.

The digital transmission system will also be used by toll management system to connect plaza computer system at each interchange with the Traffic Control Centre system.

8.26.5 Power Supply System

Power supply system will be provided to each interchange to supply to the power to the equipment installed at interchange and to the roadside equipment installed near interchange. As no equipment is installed at location at mid-section between interchanges, all equipment

for highway management system, toll management system and office use will be supplied by the system.

Each power supply system at interchange will have the capacity suitable for the demand. Generator will be provided to supply power in case of power interruption. Uninterruptible power supply will also be installed to supply stable power to the equipment required to operate without stoppage.

8.27 Facility Deployment Standard

These field devices will be installed at the locations selected based on the facility deployment standard as presented in Table 8-4 to standardize the location. It is noted that locations are adjusted for a short distance to avoid the place which is not suitable for installation such as tunnel and bridges (ref Figure 8-24 and Figure 8-25).

Table 8-4: Facility Deployment Standard

Facility	Location
Variable message sign (VMS)	200 meter upstream of the start of deceleration lane
	200 meter upstream of on-ramp to PRR
Closed Circuit Television (CCTV) camera	Merging and diverting sections at on-ramp of each IC and junction To be installed on the gantry for VMS
Automatic Traffic Counters-cum-classifier (ATCC)	Each Section between ICs.

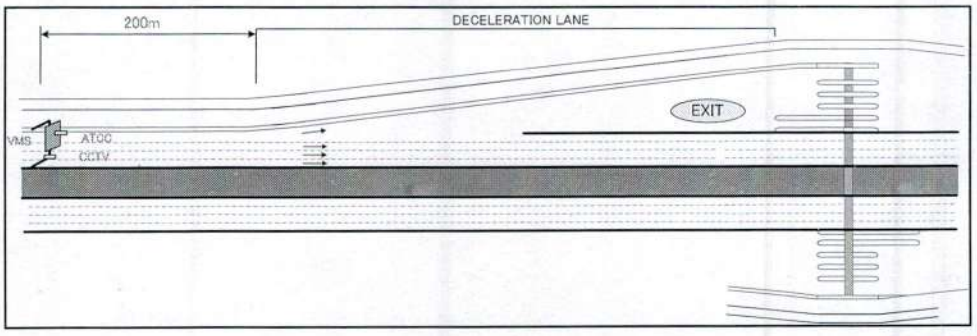

Figure 8-24: Part Plan of VMS Position at Approach to Toll Plaza

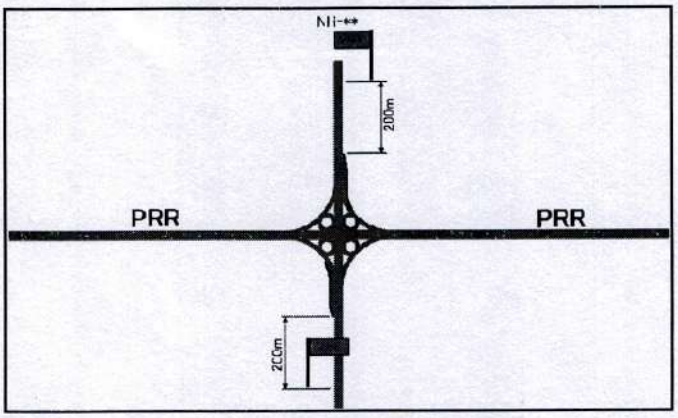

Figure 8-25: Location of VMS at Interchange

SECTION – 9

COST ESTIMATE AND IMPLEMENTATION PLAN

9 COST ESTIMATE AND IMPLEMENTATION PLAN

9.1 General

Cost estimation is important for the feasibility study as it provides vital input to the economic and financial evaluation of the project. The cost estimates have been prepared for project road in three sections covering all components of works – earthwork, pavement, CD structures, bridges and major structures, road furniture, toll plaza etc. Costs for other items of work which are not directly related to construction, but required for effective project implementation - utility shifting / relocation, designs, surveys, approval, environmental mitigation measures, rehabilitation and resettlement measures are also included.

9.2 Unit Rates

Cost estimates for various items of work are computed using unit rates given in National Highways SR, Bangalore circle 2018-19 for most of the items of work. Unit rates from manufactures / consultants previous experience / KPWD SR for the year 2018-19 are also used for few items of work which are not covered in NH SR. Area weightage of 6% as applicable for Bangalore city is considered.

The Bill of Quantities are worked out based on revised cross section parameters and revised schedule of rates.

9.3 Items of Work

Following items of work are considered in Bill of Quantities and Cost Estimate (NH SR 2018-19):

- Site clearance and Earthwork
- Pavement – flexible and rigid for service road and main road
- Drainage and protective works
- CD structure works
- Major structures – minor bridges, flyovers, underpasses, railway crossing structures,
- Toll Plaza works
- Road appurtenances – signage, road markings, crash barrier, delineators, kerbs etc
- Miscellaneous – lighting, landscaping,
- Maintenance – regular and periodic

9.6.4 Assumptions and Inputs

The analysis for the project road is being carried out considering the following assumptions;

- Analysis period is taken as 35 years starting from 2019
- Construction period taken as 3 years for all sections, i.e. 2019–2021 with 30%, 45% and 25% outlay respectively

Traffic composition has been taken same as assigned traffic as per details given in Table 9-4.

Table 9-4: Traffic Proportion of Main Road

Section	Car	LCV	Mini Bus	Bus	2AT	3AT	MAV
Sec-1	73.29%	6.85%	1.47%	3.18%	5.40%	5.07%	4.74%
Sec-2	63.55%	7.67%	2.15%	4.66%	8.77%	7.61%	5.59%
Sec-3	60.42%	6.86%	2.10%	6.42%	9.07%	9.20%	5.93%

- The economic cost for all the items has been assumed as 90% of the financial cost.
- Section-wise financial cost of the project without land acquisition and R&R cost has been presented in Table 9-5.

Table 9-5: Section Wise Financial Cost

Section	Financial cost without Land Acquisition and R&R (Crore Rs)	Length in Km	Financial Cost per Km in Rs.	Economic Cost per Km in Rs.
Section – 1	1514.00	18.367	824304459.1	741874013.2
Section – 2	1228.00	17.956	683893963	615504566.7
Section – 3	2127.00	28.792	738746874.1	664872186.7

- Salvage value considered as 20% of economic cost at the end of analysis period.

Vehicle input values are presented in

- Table 9-6.

Table 9-6: Vehicle Input Values considered at Economic Prices (2019)

Item	Car	LCV	Mini Bus	Bus	2-Axle Truck	3-Axle Truck	Multi Axle Truck

Project road is divided into three homogenous sections between National Highways. Traffic volume counts vary in all these sections. Section-wise traffic is considered in the economic analysis.

9.6.2 Traffic Assignment

The traffic assignment on the proposed road has been carried out based on the traffic volume survey conducted in January 2019. An assessment of section-wise diverted traffic to PRR in the implementation year i.e. 2022 has been made from the above data as shown in Table 9-3.

Table 9-3: Assigned AADT for the Project Road in 2022

Section Details	Car	LCV	Mini Bus	Bus	2AT	3AT	MAV	Daily Total, No
Section-1	22860	2138	459	992	1683	1582	1479	31193
Section-2	19734	2382	667	1448	2724	2362	1736	31053
Section-3	17805	2021	620	1891	2673	2712	1747	29469

Efforts to get the growth rates for various categories of vehicles have been made after analysing the general growth trends in number of registered vehicles, economic indicators of the project region, etc. The traffic growth rates derived by econometric method is compared with growth rates from past traffic data. The final growth rates for diverted traffic adopted in the project are presented in Table 2-31.

9.6.3 Approach to Economic Analysis

The economic analysis of the project road has been carried out through HDM 4-Version 1.3. It allows accessing the physical, functional and economic feasibility of the specified project alternative by comparing against a base case or a 'Without Project/Do Nothing' alternative. The analysis covers the following;

- Life cycle costing of pavement structural performance
- Prediction of road deterioration
- Estimation of road user costs (vehicle operating costs, travel time and accidents)
- Modeling of road works effects and costs associated to the road administration
- Calculation of economic and financial benefits by comparing project alternatives
- Maintenance of existing roads

9.6 Economic Analysis

9.6.1 Introduction

The proposed Peripheral Ring Road (PRR) is planned beyond ORR at a distance of 17km to 25km from city centre. The proposed road is planned for following purposes:

- To take away commercial vehicles and long distance passenger cars from the city.
- Reduce traffic congestion on all existing radial roads leading to existing Outer Ring Road.
- Reduce traffic congestion on existing Outer Ring Road.
- Create a new road network beyond ORR considering future needs for the city.

The proposed will act as an important link for Bangalore city from mobility of view, as present ORR and city roads are congested. The improvement proposal of development of PRR involve certain social costs in terms of utilization of scarce resources and public investment, to have significant benefits flowing to the society. It becomes imperative to undertake an economic analysis to examine whether such projects are significantly beneficial to the society or the economy.

The improvement will bring about a reduction of vehicle operating costs, travel time, accidents, environmental hazards etc. In the present analysis, the benefits are accrued from saving in vehicle operating costs (VOC) and travel time costs for passengers and goods (VOT). The following sections describe the steps followed in the economic analysis using HDM-4, considering inputs from the prevailing ground situation. Section-wise details are shown in Table 9-2.

Table 9-2: Details of Existing & Proposed Road

Section	Project Stretch along PRR	Existing Road Length (km)	Proposed PRR Length (km)	Remarks
Section-1	Km 0.000 (Tumkur road) to Km 18.367 (Bellary	22.612	18.367	1) Existing road is 6 lane 2) Peripheral Ring Road (PRR) is 8-lane with service road
Section-2	Km 18.367 (Bellary Road) to Km 36.323 (Old	29.038	17.956	
Section-3	Km 36.323 (Old Madras Road) to Km 65.115 (Hosur Road)	32.471	28.792	

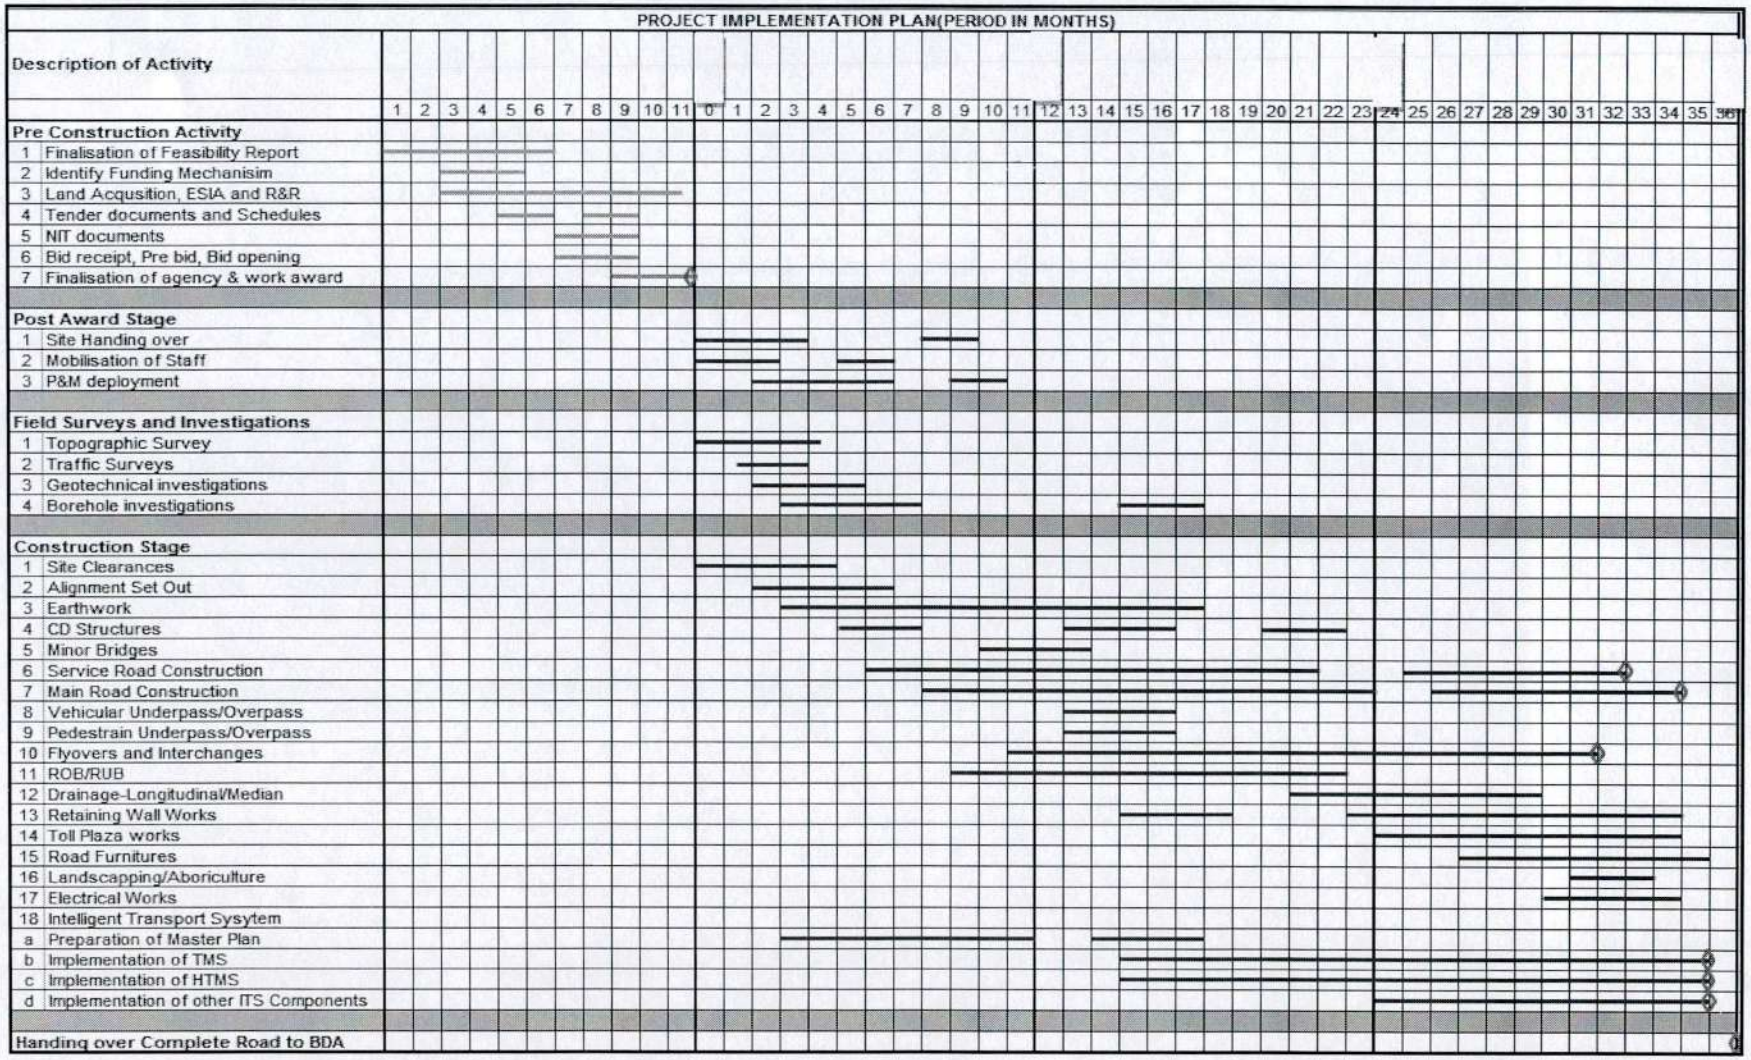

Figure 9-1: Tentative Project Implementation Plan

appointed Independent Engineer and finally issue "Good For Construction" drawings to contractor in line with construction planning and sequence of work.

Tentative project implementation plan is given in Figure 9-1.

9.4 Project Cost

The proposed PRR is a green field project. The estimated project civil construction cost is Rs 4869 Crores.

Revenue surveys were completed to substantial portion recently. Assessment of Total cost of land acquisition is in progress.

The above costs does not cover costs towards implementation of ITS for Bengaluru City and PRR. During recent meeting BDA had with JICA on 22-01-2020, JICA suggested BDA to include ITS towards Bengaluru city to be part of the project and be compatible with PRR project. The technical details and costs towards ITS were provided by DULT in 2015 is Rs 800.00 Cr. The Civil Cost indicated above does not include costs of ITS.

9.5 Implementation Plan

The project road of 65 Km is split into 3 sections (ref Table 9-1) so that BDA can take up the construction activity and complete them concurrently. The project road crosses existing National Highways at four locations and hence for the sake of convenience, section break up are drawn at NHs.

Table 9-1: Project Sections for Implementation

Stretch No	Starting	Ending	Length, Km
1	Km 0.000 (Tumkur road)	Km 18.367 (Bellary Road)	18.367
2	Km 18.367 (Bellary Road)	Km 36.323 (Old Madras Road)	17.956
3	Km 36.323 (Old Madras Road)	Km 65.115 (Hosur Road)	28.790

BDA proposes the project to be taken up on Item Rate Contract with Good For Construction Drawings made available to the contractor during construction. The total time frame required for construction of all civil works including toll plaza will be between 30 months – 36 months depending on the section and 18 months is set aside for implementation of Intelligent Transport System (ITS) for the project as a whole. In addition, it is a period of 12 months for implementation of other ITS components is estimated. It is expected that BDA hands over construction land free of encumbrances to an extent that sufficient front is available to contractor. The contractor is expected to carry out required field surveys and investigations, carry out designs and prepare "For Approval" drawings and get it approved by BDA

Item	Car	LCV	Mini Bus	Bus	2-Axle Truck	3-Axle Truck	Multi Axle Truck
Vehicle Price Rs.	4,14,320	6,33,500	8,50,000	10,70,005	11,08,216	12,49,971	14,59,937

PCSE	1	1.3	1.3	2	2	2	2.2
Working Hours	1,950	1,500	850	2,200	2,100	2,100	2,100
Annual km	32,000	60,000	34000	1,00,000	75,000	75,000	75,000
Avg. life (Years)	10	8	8	8	8	8	8

- Rise and Fall – 2.5, -1.2 & 0.8 m/Km for 3 sections respectively
- No. of Rise and Falls – 2 / Km for all sections
- Average curvature – 10.2, 13.0 & 11.6 deg./ Km for 3 sections respectively
- Speed Limit – 45.65 Km/hr for existing roads of Section-1, 26.29 Km/hr for existing roads of Section-2 and 36.51 Km/hr for existing roads of Section-3. For proposed PRR speed limit has been assumed as 65 Km/hr for all sections.
- Sub grade CBR – 8%
- Roughness (IRI) – 1.5 m/km (after periodic maintenance in year 2018) for existing roads and 1.5 m/km for new road

- Total cracking area – 15% for existing roads and 0% for new road
- Total raveling area – 15% for existing roads and 0% for new road
- No of potholes – 10 nos/km for existing roads and 0 nos/km for new road
- Edge break area – 10 sqm/km for existing roads and 0 sqm/km for new road
- Rut depth – 10 mm for existing roads and 0 mm for new road
- Recent Surface thickness assumed for existing roads – 50 mm
- No non–motorized vehicle has been considered in the analysis
- Average altitude – 900 m
- Discount rate – 12%

9.6.5 Alternatives

For the project road, following options are considered:

- Without Project / Do-Nothing scenario: No improvement for 6 lane existing road is proposed, only routine and periodic maintenance are considered. Traffic will continue to use existing road network in absence of Peripheral Ring Road.
- With Project / Improvement scenario: Construction of new 8 lane Peripheral Ring Road (PRR) with routine and periodic maintenance and existing road with routine and periodic maintenance are considered. This consists of two parts:
    - Reduction in VOC for traffic on new PRR (Bypass alignment)
    - Reduction in VOC on existing roads (ORR and interconnecting radial roads)

9.6.6 Project Cost and Maintenance

For the purpose of carrying out the economic analysis, the cost estimate of the road has been prepared considering road, structures and other amenities and facilities separately. The construction is expected to start in 2019 and be completed in the year 2022, construction period being estimated as 36 months.

The total cost of the improvement has been worked out as Rs 4869 crores at current financial prices (excluding land acquisition) for the total length. The distribution of cost has been estimated as 30% in first year, 45% in second and 25% in third year.

The maintenance works considered for all sections of Existing road and proposed PRR are presented in Table 9-7.

Table 9-7: Maintenance Requirements

Sl No.	Maintenance Work for Existing Road	Maintenance Work for proposed PRR
1	Patching and crack seal as routine maintenance with periodicity of 1 year	Patching and crack seal as routine maintenance with periodicity of 1 year
2	50mm BC overlay as Periodic maintenance at every 6th year	50mm SMA overlay as Periodic maintenance at every 6th year

Though maintenance costs have been used as inputs, the cost stream has been worked out based on the routine maintenance cost of Rs.3.5 lakh/km (in 2011-12) for 4 lane flexible highway as per MORTH circular for analysis and worked out the projected maintenance costs for existing 6 lane and proposed 8 lane configurations in base year 2019.

Periodic maintenance cost of approx. Rs.56 lakh/km for 50mm BC on existing 6 lane road & approx. Rs.63 lakh/km for 50mm SMA on proposed 8 lane PRR are worked out.

Base Year Maintenance costs for existing 6 lane road and 8 lane road are as shown in Table 9-8.

Table 9-8: Maintenance Costs

Maintenance Activity	Without Project (Rs. Lakhs / Km)	With Project (Rs. Lakhs / Km)	
	6 Lane Existing Road	8 Lane PRR	6 Lane Existing Road
Routine Maintenance (every year)	7	10	7
Periodic Maintenance (every 6th year)	84	126	84

9.6.7 Project Benefits

Road user benefits will be from vehicle operating cost (VOC) savings, value of travel time (VOT) saving and saving in maintenance costs. Social benefits will accrue from improvements in quality of life and environment and appreciation of abutting land value, which have not been included in the analysis. Section-wise cost and benefit streams as generated through HDM are shown in Table 9-9, Table 9-10 and Table 9-11 respectively.

Table 9-9: Undiscounted Comparison of Cost Streams for Section-1

Year	Increase in Road Agency Costs	Decrease in Road User Costs			Net Benefit
		VOC	VOT	Total	
2019	4087.80	0.00	0.00	0.00	-4087.80
2020	6131.70	0.00	0.00	0.00	-6131.70
2021	3406.50	0.00	0.00	0.00	-3406.50
2022	17.59	1495.28	3306.36	4801.64	4784.05
2023	18.05	1680.65	3628.99	5309.64	5291.59
2024	18.52	1445.30	2237.86	3683.16	3664.64
2025	19.01	1252.59	2447.27	3699.87	3680.86
2026	19.50	1358.64	2676.62	4035.25	4015.75
2027	255.62	1534.33	2927.81	4462.15	4206.53
2028	20.53	1753.87	3203.02	4956.89	4936.35
2029	21.07	1935.81	3464.41	5400.23	5379.16
2030	21.62	2071.18	3758.42	5829.60	5807.98
2031	22.18	2000.70	4077.72	6078.42	6056.24
2032	22.76	2182.33	4424.51	6606.84	6584.08

All costs are expressed in: INR (million)

9.6.8 NPV and EIRR

The EIRR and NPV values along with other indicators for the three sections are presented in Table 9-12. It has been observed that the EIRR values for moderate/ heavily trafficked sections (Section–1, Section–2 and Section-3) work out to be 26.93%, 40.50% and 24.87% respectively.

Table 9-12: Section wise EIRR and NPV Values

Sections	Net Present Value (million Rs)	Internal Rate of Return (%)
Section-1: Km 0.000 (Tumkur road) to Km 18.367 (Bellary Road)	**17,578**	**26.93**
Section-2: Km 18.367 (Bellary Road) to Km 36.323 (Old Madras Road)	**28,892**	**40.50**

Sections	Net Present Value (million Rs)	Internal Rate of Return (%)
Section-3: Km 36.323 (Old Madras Road) to Km 65.115 (Hosur Road)	**26,768**	**24.87**

9.6.9 Sensitivity Analysis

The alternatives decided for the analysis will include probable variation in traffic, cost escalation, reduction in benefits etc which are difficult to predict for the future. Hence, sensitivity analysis is carried out considering the following scenarios:

- Case-1 : No variation in cost and no variation in benefits
- Case-2 : 15% increase in cost and no variation in benefits
- Case-3 : No variation in cost and 15% reduction in benefits
- Case-4 : 15% increase in cost and 15% reduction in benefits

Table 9-13: Sensitivity Analysis, Section-wise EIRR

S.No.	Details	EIRR		
		PRR SEC-1	PRR SEC-2	PRR SEC-3
1	Case-1 : No variation in cost and no variation in benefits	26.93%	40.50%	24.87%
2	Case-2 : 15% increase in cost and no variation in benefits	24.15%	36.29%	22.28%
3	Case-3 : No variation in cost and 15% reduction in benefits	23.71%	35.64%	21.89%
4	Case-4 : 15% increase in cost and 15% reduction in benefits	21.16%	31.86%	19.62%

9.6.10 Conclusions

From the economic analysis, it can be inferred that the project IRR (EIRR) is more than **19%** with B/C ratio greater than 1.4, which implies that the project is economically viable.

Construction of new road around Bangalore city will reduce the traffic congestion on existing ORR and radial roads connecting to ORR.
