

# COMPREHENSIVE MOBILITY PLAN FOR BENGALURU

FINAL REPORT - 2020

Bangalore Metro Rail  
Corporation Limited

Directorate of Urban Land Transport,  
Urban Development Dept., GoK.

Prepared by:

Infrastructure Development  
Corporation (Karnataka) Limited.

**TABLE OF CONTENTS**

| Chapter | Description  | Page Nos. |
|---------|--|-----------|
|         | EXECUTIVE SUMMARY .....  | I-XX      |
| 1       | INTRODUCTION .....   | 1-1       |
| 1.1     | Sustainable Mobility Principles .....  | 1-2       |
| 1.1.1   | Access .....   | 1-2       |
| 1.1.2   | People and Communities .....   | 1-2       |
| 1.1.3   | Environmental Quality .....  | 1-3       |
| 1.1.4   | Economic Viability .....   | 1-3       |
| 1.2     | Impact of Regional/National Framework .....  | 1-4       |
| 1.2.1   | National Framework .....   | 1-4       |
| 1.2.2   | Regional Framework .....   | 1-6       |
| 1.3     | National Urban Transportation Policy (NUTP) .....  | 1-7       |
| 1.4     | Delineation of Planning Area .....   | 1-8       |
| 1.5     | Vision, Mission and Objectives of the Mobility Plan .....  | 1-8       |
| 1.5.1   | Vision: Efficient and Sustainable Transportation for All .....   | 1-8       |
| 1.5.2   | Mission: Build a multi-modal transport system for equitable mobility access and minimized negative externalities ..... | 1-9       |
| 1.6     | Review of Available Resources .....  | 1-10      |
| 1.7     | Stakeholder’s Identification .....   | 1-16      |
| 1.8     | Approach and Methodology .....   | 1-19      |
| 2       | Review of City Profile .....   | 2-1       |
| 2.1     | Brief Profile of the Study Area .....  | 2-1       |
| 2.2     | Review of Existing Transport System .....  | 2-3       |
| 2.2.1   | Road Network .....   | 2-3       |
| 2.2.2   | Public Transport System .....  | 2-6       |
| 2.2.3   | Non-Motorized Transport .....  | 2-10      |
| 2.2.4   | Intermediate Public Transport .....  | 2-13      |
| 2.2.5   | Vehicle Growth in the City .....   | 2-14      |
| 2.2.6   | Goods Transport .....  | 2-15      |
| 2.2.7   | Parking .....  | 2-15      |
| 2.2.8   | Road Accidents .....   | 2-17      |

|       |  |      |
|-------|--|------|
| 2.3   | Review of Energy and Environment .....   | 2-18 |
| 2.4   | Review of Existing Land Use Pattern .....  | 2-20 |
| 2.5   | Traffic Surveys .....  | 2-22 |
| 2.5.1 | Classified Volume Count .....  | 2-23 |
| 2.5.2 | Outer Cordon Road Side Interview .....   | 2-31 |
| 2.5.3 | Parking surveys .....  | 2-35 |
| 2.5.4 | Boarding / Alighting Surveys .....   | 2-43 |
| 2.5.5 | Terminal Surveys .....   | 2-44 |
| 2.5.6 | Household Interview Survey .....   | 2-48 |
| 2.5.7 | Modal Share .....  | 2-50 |
| 2.5.8 | Road Network Inventory .....   | 2-52 |
| 2.6   | Summary of Existing Traffic and Transport Conditions .....                                 | 2-55 |
| 2.6.1 | Traffic Characteristics .....  | 2-56 |
| 2.6.2 | Public Transport Characteristics .....   | 2-57 |
| 2.6.3 | Household Interview Survey .....   | 2-57 |
| 2.6.4 | Road Inventory and Speed & Delay Survey Characteristics .....                              | 2-58 |
| 2.7   | Service Level Benchmarking .....   | 2-58 |
| 3     | TRANSPORT DEMAND ASSESSMENT AND DEVELOPMENT OF SUSTAINABLE URBAN TRANSPORT SCENARIOS ..... | 3-1  |
| 3.1   | BUSINESS AS USUAL (BAU) SCENARIO` .....  | 3-1  |
| 3.1.1 | Travel Demand Model Development .....  | 3-1  |
| 3.1.2 | Socio-Economic Transitions .....   | 3-1  |
| 3.1.3 | Land use Transitions .....   | 3-2  |
| 3.1.4 | Business as Usual Scenario (Do Minimum) .....  | 3-5  |
| 3.1.5 | Summary of BAU Scenario .....  | 3-6  |
| 3.2   | Development of Sustainable Urban Transport Scenario .....                                  | 3-8  |
| 3.2.1 | Strategic Framework for the Scenarios .....  | 3-8  |
| 3.2.2 | Alternate Strategies for Sustainable Urban Transport .....                                 | 3-13 |
| 3.2.3 | Comprehensive Mobility Strategy .....  | 3-14 |
| 3.3   | Analysis and Indicators .....  | 3-15 |
| 3.4   | Conclusions .....  | 3-16 |
| 4     | Development of Comprehensive Mobility Plan .....   | 4-1  |
| 4.1   | Integrated Land use and Mobility Plan .....  | 4-1  |
| 4.1.1 | Revised Master Plan 2031 .....   | 4-1  |
| 4.1.2 | Transit Oriented Development Policy 2019 .....   | 4-2  |

|        |  |      |
|--------|--|------|
| 4.1.3  | Recalibration of the RMP 2031.....               | 4-3  |
| 4.2    | Public Transport Improvement Plan.....           | 4-4  |
| 4.2.1  | Rail-based Public Transport.....                 | 4-5  |
| 4.2.2  | Road Based Public Transport.....                 | 4-9  |
| 4.2.3  | Overall Public Transport Network-2031.....       | 4-14 |
| 4.2.4  | Intermediate Para-transit and New Mobility.....  | 4-16 |
| 4.3    | Road Network Development Plan.....               | 4-17 |
| 4.3.1  | Throughput and Quality Improvement Measures..... | 4-17 |
| 4.3.2  | Capacity Addition.....                           | 4-28 |
| 4.3.3  | Parking Infrastructure.....                      | 4-34 |
| 4.3.4  | Road Safety.....                                 | 4-38 |
| 4.4    | Non-Motorized Transport Plan.....                | 4-39 |
| 4.4.1  | Area Mobility Improvement Plan (AMIP).....       | 4-40 |
| 4.4.2  | Station Area Access Plan (SAAP).....             | 4-41 |
| 4.4.3  | Pedestrian Streets.....                          | 4-41 |
| 4.5    | Multi Modal Mobility Plan (MMMP).....            | 4-42 |
| 4.5.1  | Multi Modal Mobility Infrastructure.....         | 4-42 |
| 4.5.2  | Multi Modal Mobility Fare System.....            | 4-45 |
| 4.5.3  | Inter City Mobility.....                         | 4-45 |
| 4.6    | Private Transport Management Plan.....           | 4-47 |
| 4.7    | Freight Movement Plan.....                       | 4-47 |
| 4.8    | Technological Measures.....                      | 4-49 |
| 4.8.1  | Intelligent Transport Systems.....               | 4-50 |
| 4.8.2  | Traffic Management Center.....                   | 4-51 |
| 4.8.3  | Smart Signalization.....                         | 4-51 |
| 4.8.4  | Vehicle Technology.....                          | 4-52 |
| 4.9    | Travel Demand Management Plan.....               | 4-52 |
| 4.10   | Regulatory Measures.....                         | 4-52 |
| 4.10.1 | Levy of Usage of Road Resource.....              | 4-53 |
| 4.10.2 | Fare Regulations for Urban Transport.....        | 4-53 |
| 4.10.3 | Data Sharing Standards for Urban Transport.....  | 4-53 |
| 4.11   | Governance Measures.....                         | 4-54 |
| 4.12   | Fiscal Measures.....                             | 4-55 |
| 4.13   | Action Plan and Budget Plan.....                 | 4-55 |
| 4.14   | Monitoring and Evaluation Plan.....              | 4-58 |

|        |   |      |
|--------|---|------|
| 4.15   | Engagement of Stakeholders including citizens.....                    | 4-58 |
| 4.16   | Mobility Improvement Measures and NUTP Objectives.....                | 4-58 |
| 4.17   | Impact of Proposed Measures on Service Level bench Marks.....         | 4-60 |
| 4.17.1 | Public Transport facilities.....                                      | 4-60 |
| 4.17.2 | Travel Speed (Motorized and Mass Trasnsit) along Major Corridors..... | 4-61 |
| 4.17.3 | Availability of Parking Spaces .....                                  | 4-61 |
| 4.17.4 | Road Safety .....   | 4-61 |
| 4.17.5 | Pollution Levels.....   | 4-62 |
| 4.17.6 | Integrated Land Use Transport Systems.....                            | 4-62 |
| 4.17.7 | Sustainability of Public Transport .....                              | 4-62 |
| 5      | IMPLEMENTATION PLAN.....  | 5-1  |
| 5.1    | Phasing of Implementation Plan .....                                  | 5-1  |
| 5.2    | Funding of Projects .....   | 5-7  |
| 5.2.1  | Funding Options .....   | 5-7  |
| 5.2.2  | Funding Options for Urban Transport Project.....                      | 5-14 |
| 5.3    | Monitoring of CMP .....   | 5-16 |
| 5.4    | Stakeholder's Consultation .....                                      | 5-21 |

## LIST OF TABLES

|   |      |
|---|------|
| Table 1-1: Proposed Bangalore Sub-urban Rail Network                          | 1-13 |
| Table 2-1: Highlights of Master Plans of BMA                                  | 2-1  |
| Table 2-2: Growth of Population in Bangalore Metropolitan Area                | 2-2  |
| Table 2-3: Population of BIAAPA   | 2-2  |
| Table 2-4: Comparison of Work Force in BMA                                    | 2-3  |
| Table 2-5: Green Time Wasted at Signalized junctions                          | 2-5  |
| Table 2-6: BMTC Performance   | 2-6  |
| Table 2-7: BMTC Buses Per Lakh Population-Chart                               | 2-7  |
| Table 2-8: Metro Corridors along with the Stretches and their Status          | 2-8  |
| Table 2-9: Road Accident Scenario of Bangalore City                           | 2-17 |
| Table 2-10: Total Emissions   | 2-19 |
| Table 2-11: ELU Area Statement  | 2-20 |
| Table 2-12: Survey Particulars  | 2-22 |
| Table 2-13: Peak hour Traffic volume at Screen line Locations                 | 2-24 |
| Table 2-14: Total Volume for 24 hours and peak hour on surveyed location      | 2-28 |
| Table 2-15: Turning Volume Count Locations exceeding 10000 PCUs               | 2-29 |
| Table 2-16: Passenger Traffic at Outer Cordon Locations                       | 2-31 |
| Table 2-17: Share of Passenger and Goods traffic at outer cordon Locations    | 2-32 |
| Table 2-18: Daily Goods Traffic volume coming in to Bangalore                 | 2-33 |
| Table 2-19: Daily Goods Traffic Volume going from Bangalore                   | 2-33 |
| Table 2-20: Summary of Goods Traffic Movement                                 | 2-34 |
| Table 2-21: Summary of On-Street Parking Accumulation                         | 2-41 |
| Table 2-22: Details of Parking fee at some Off-street Parking Areas           | 2-42 |
| Table 2-23: Distribution of Bus Stop Passengers by Trip Purpose               | 2-44 |
| Table 2-24: Distribution of Daily Passengers at Major Bus Terminals           | 2-44 |
| Table 2-25: Mode wise Bus Passenger Dispersal Distribution                    | 2-45 |
| Table 2-26: Distribution of Passengers by Travel Time to Reach Bus Terminals  | 2-46 |
| Table 2-27: Distribution of Passengers by Travel Frequency at Bus Terminals   | 2-46 |
| Table 2-28: Distribution of Air passengers by trip per purpose                | 2-47 |
| Table 2-29: Mode wise Distribution of air passengers dispersal                | 2-48 |
| Table 2-30: Mode wise Average Trip Length                                     | 2-52 |
| Table 2-31: Distribution of Road Length by Right of Way                       | 2-52 |
| Table 2-32: Distribution of Road Network as per Carriageway Width             | 2-53 |
| Table 2-33: Distribution of Road Length by Availability of Service Road       | 2-53 |
| Table 2-34: Distribution of Road Length by Availability of Footpath           | 2-54 |
| Table 2-35: Entry / Exit of Goods Vehicle at Surveyed Location                | 2-54 |
| Table 2-36: Modal Split (Motorised Trips)                                     | 2-58 |
| Table 2-37: Summary of Service Level Bench Mark                               | 2-65 |
| Table 3-1: Summary of forecasted Population                                   | 3-2  |
| Table 3-2: Proposed Land use-2031   | 3-3  |
| Table 3-3: Comparison on Travel characteristics between Base Year and Horizon | 3-7  |
| Table 3-4: Forecast Modal Share (Option 1)                                    | 3-13 |
| Table 3-5: Forecast Modal Share (Option 2)                                    | 3-14 |
| Table 3-6: Forecast Modal Share (Option 3)                                    | 3-15 |

## EXECUTIVE SUMMARY

### 1. Background

Bengaluru is one of the major engines of economic growth for the entire country. For the state of Karnataka, the city accounts for almost 36% of the Gross State Domestic Product. With its robust and extensive eco-system for professional education, scientific and technical research, information technology, electronics design, and start-up opportunities, the city has been generating huge economic opportunities and jobs for highly skilled to semi-skilled populations, attracted from within the state as well as outside. The massive pace of growth of the city's population necessitates expansion and upgradation of the city's infrastructure, housing stock for different income segments and public services. In particular, the urban mobility infrastructure has fallen behind the curve, with the increasing road congestion, longer commute times and environmental stresses emerging as the binding constraints for the city's march towards achieving its ecologically sustainable economic potential.

A coordinated effort to improve mobility in Bengaluru by setting-up efficient and sustainable transportation eco-system is critically relevant. The comprehensive mobility plan is the first step in that direction to provide the overall framework for integrating various transport sub-systems and addressing the needs of various segments of population.

### 2. Vision, Mission and Objectives of the Mobility Plan

**Vision:** Efficient and Sustainable Transportation for All

**Mission:** Build a multi-modal transport system for equitable mobility access and minimized negative externalities

- Goal 1: Increase mode share of public transport in meeting transport demand
- Goal 2: Regain road infrastructure as public good
- Goal 3: Reduce transport sector contribution to air pollution and GHG emissions

### 3. Study Area

The study area includes whole of Bengaluru Metropolitan Area (LPA area: 1294.00 Sq.km), part of Bangalore - Mysore Infrastructure Corridor Area (BMICAPA part area: 79.14 Sq.km.) and part of Bangalore International Airport Area Local Planning Authority (BIAA-LPA part area: 227.85 Sq.km). The access controlled NICE Road on West-South periphery of the city as part of the BMI corridor has facilitated opening of new areas of urban development; a part of the BMICAPA has been included in the study area accordingly. The development of Airport near Devanahalli and transport infrastructure development in the form of 6 lane access controlled road between Hebbal and Airport has triggered development around airport and near Devanahalli. To ensure planned development, BIAA-LPA has been established to oversee the development of the identified area. The BIAA-LPA study area reveals that most of the developments are in two administrative areas namely Jala Hobli and Kasba Hobli. Considering this and to account its impact on the city development part of BIAA-LPA area extending 227.85 Sq.km has been included in the planning area for CMP.

#### 4. Approach and Methodology

A brief methodology adopted for preparation of Comprehensive Mobility Plan for Bengaluru is presented below:

| <b>STAGE 1: Defining NEED and SCOPE for Comprehensive Mbility Plan for Bengaluru</b>  |  |   |
|---|--|---|
| Stage 1.1: Establishing Need, Defining Vision & Objectives for Bengaluru <ul style="list-style-type: none"> <li>Review of vision for Bengaluru from Master Plan and Other Economic studies</li> <li>Defining Need for preparation of CMP</li> <li>Defining Vision ( in coherence to the vision for Bengaluru from Master plan and other Economic plans)</li> <li>Objectives of CMP for Bengaluru</li> </ul> | Stage 1.2: Delineation of Planning area <ul style="list-style-type: none"> <li>Reconnaissance of Bengaluru Region</li> <li>Delineation of planning area to plan CMP</li> </ul> | Stage 1.3: Defining Planning Horizon <ul style="list-style-type: none"> <li>Short term</li> <li>Long term</li> <li>Medium term</li> </ul> |

| <b>STAGE 2: Existing Situation Analysis &amp; Data Collection</b>   |   |  |
|---|---|--|
| Stage 2.1: Review of existing population characteristics through secondary sources <ul style="list-style-type: none"> <li>Review of Regional Profile</li> <li>Review of land use patterns, characteristics of population, population density</li> <li>Review of Socio economic profile</li> <li>Review of Energy and Environment</li> </ul> | Stage 2.2: Review of existing transport characteristics through secondary sources <ul style="list-style-type: none"> <li>Review of Road infrastructure</li> <li>Assessment of public Transport infrastructure</li> <li>Review of IPT infrastructure</li> <li>Review of Mass transit infrastructure</li> </ul> | Stage 2.3: Study of Existing travel pattern and Behaviour through surveys and data collected for revised master plan 2015 <ul style="list-style-type: none"> <li>Road network inventory</li> <li>Classified turning volume counts.</li> <li>Speed and delay</li> <li>Pedestrian count surveys</li> <li>Parking surveys</li> <li>Bus boarding alignment survey</li> <li>IPT survey</li> <li>Cordon survey</li> <li>Rail passenger survey</li> </ul> |

| <b>STAGE 3: Defining Benchmarks</b>  |  |
|--|--|
| Defining Benchmarks for various scenarios in order to come up with best scenario |  |

| <b>STAGE 4: Scenario Development</b>                 |  |
|--|--|
| Stage 4.1: Development of Business as Usual scenario | Stage 4.2: Development of Sustainable Urban Transport Scenario |

| <b>STAGE 5: Four Stage Mbdeling to test BAU and other Sustainable Urban Transport Scenario</b> |  |
|--|--|
| STAGE 6: DEVELOPMENT OF URBAN MOBILITY PLAN  |  |

|   |
|---|
| Stage 6.1: Formulation of Plans <ul style="list-style-type: none"> <li>Integrated land use and urban mobility plan</li> <li>Public transport improvement plan</li> <li>Road network development program</li> <li>NMT facility improvement plan</li> <li>Multimodal integration plan</li> <li>Intermodal public transport plan</li> <li>Traffic engineering and Management plan</li> <li>Travel demand measures for Bengaluru</li> </ul> |
|---|

| <b>STAGE 7: Formulation Implementation Program For CMP</b> |  |
|--|--|
| Stage 7.1: Formulation of REGULATORY MEASURES              |  |
| Stage 7.2: Formulation of INSTITUTIONAL STRATEGY           |  |
| Stage 7.3: Formulation of FISCAL STRATEGY                  |  |

## 5. Data collection and Survey Findings

The purpose of conducting traffic surveys is to assess the traffic and the transport characteristics of the study area and provide inputs to develop the transport model. The data collected from earlier studies like Revised Master Plan -2031, RITES Revised Final Report of Phase-III Corridors of Bengaluru Metro, 2016, Comprehensive Traffic and Transportation Study for Bengaluru Metropolitan Region (BMR)-2018 and Parking Action Plan for Bengaluru have been used for the current study.

Important observations from the survey analyses are presented in the following section:

### Traffic Characteristics

- The major road network is congested uniformly. The highest peak hour traffic at screen line locations is 10,699 PCUs (11,989 vehicles).
- The traffic volumes at most of junctions have already exceeded capacity. Junctions i.e. Central Silk Board, KR Puram, Hebbal are having more than 3 lakhs vehicles per day.
- The major traffic enters the city through NH-7 (Hosur road). The highest percentage of goods vehicles enters the city through NH-4 (Tumkur Road)

### Public Transport Characteristics

- About 2.9 lakhs commuters use the inter or intra city bus terminals daily. Majestic bus terminal caters to the maximum number of passengers i.e. 70000 passengers. About 56% passengers are dispersing through buses. Share of passenger dispersal by walk and auto rickshaw is about 39% and 2% respectively.
- The City Railway Station handles 1.05 Lakh numbers of passengers daily. Out of 1.1 lakh trips of passengers, work & business purpose trips are about 25% followed by about 4% for education purpose. About 65% passengers are dispersing through buses. Share of passenger dispersal by Auto is about 20%.
- The Kempegowda Airport caters to about 90,000 passengers per day. About 72% passengers are dispersing through Car and Taxis/IPT. Share of passenger dispersal by buses is about 28%.

### Household Interview Survey

- Nearly 84% of households have motor vehicles. About 20% of the household have one car. About 60% of households have at least 1 scooter/motor cycle.
- Average household income per month in the study area was observed to be Rs. 32374.
- Average expenditure on transport per household is estimated as Rs 2473 per month, which is about 7.6% of average household income.
- A total of 12.60 Lakh peak hour trips are being performed everyday by the residents of study area. The public transport has contributed almost 48% of total trips followed by two wheelers (23.5%) and car/taxi (21%).
- Per capita trip rate including walk is 1.24, excluding walk is 0.92 and for motorized trips is 0.91.
- Average trip length for walk is 1.0 Km, for 2-wheeler 9.8 km, for car and taxi is 10.2 km and 13.1 km and for Bus it is about 12 km.

### Road Inventory and Speed & Delay Survey Characteristics

- About 43% of roads have ROW up to 10 m and 13% has ROW between 20 to 30 m. This indicates the limitation of widening for most of the roads.
- About 74% of surveyed road network length has carriageway width upto 2 lanes and only about 20% of road network 4 lanes and more.
- Footpaths are available along about 47% of the road length. Thus the majority length of road network is without footpaths.
- It is observed that the speeds on the city road network are mostly less than 20 kmph while the core area of Bangalore operates at very low speeds (less than 11 kmph) in the peak hour.

### 6. Service Level Benchmarking

| Description  | Existing LOS | Remarks  |
|--|--------------|--|
| <b>Public Transport Facilities</b>                                     | 2            | The city has Public Transport system which needs considerable improvements in terms of supply of buses/coaches and coverage as many parts of the city are not served by it. The frequency of the services also needs to be improved.   |
| <b>Non Motorised Transport (NMT) facilities</b>                        | 4            | The city lacks adequate NMT facilities.  |
| <b>Travel speed (Motorized and Mass Transit) along major corridors</b> | 4            | Significant approach delays and average travel speed of 1/3 <sup>rd</sup> or lower of the free flow speed. Such condition is causing combination of one or more reasons such as high signal density, extensive queuing at critical intersection and appropriate signal timing. |
| <b>Parking spaces</b>  | 4            | The city authority need to initiate immediate actions with respect to providing paid parking spaces and demand management for parking.   |
| <b>Road Safety</b>   | 3            | Need considerable improvements in Road design and available road infrastructure, traffic management and in other such reasons which significantly contribute to road safety.   |
| <b>Pollution levels</b>  | 2            | Needs improvement in emission standards, checking pollution etc.   |
| <b>Integrated land use transport system</b>                            | 3            | Faint coherence between study area structure and public transport system.  |
| <b>Sustainability of Public Transport</b>                              | 2            | The Public transport is financially sustainable but needs some improvement.  |

## 7. Travel Demand Assessment

The main focus of the study is to develop a long-term transportation strategy for Bengaluru with the help of an urban transport planning model. Transport Demand Modelling has been carried out to replicate the Bengaluru “real” transportation system and forecasting the state of the system for the targeted horizon year (2051) under various scenarios.

### Socio-economic Transition

The Revised Master Plan-2031 has carried out projections for the spatially constant Bengaluru Metropolitan Area. The projected population for the BMA and the extended area is shown below:

**Forecasted Population in the Study Area**

|               | 2015              | 2031              | 2041              | 2051              |
|---------------|-------------------|-------------------|-------------------|-------------------|
| BMA           | 11,227,977        | 20,313,499        | 25,709,017        | 31,636,758        |
| Extended Area | 255,449           | 550,000           | 895,892           | 1,604,406         |
| <b>Total</b>  | <b>11,483,426</b> | <b>20,863,499</b> | <b>26,604,909</b> | <b>33,241,165</b> |

### Business as Usual Scenario (Do Minimum)

In Do Minimum Business as Usual (BAU-DM) scenario, the existing road network with committed development projects are considered. The committed projects proposed by various departments are Metro Phase 2, Peripheral Ring Road, Elevated Corridors and Augmentation of BMTC buses to double the existing fleet. The results of BAU-DM scenario are presented in the table below

### Comparison on Travel characteristics between Base Year and Horizon Year

| Modes                            | Base Year (2015) |            | BAU (2031)       |            |
|----------------------------------|------------------|------------|------------------|------------|
|                                  | Peak Hour Trips  | Mode Share | Peak Hour Trips  | Mode Share |
| Car+Taxi                         | 264,649          | 21%        | 689,673          | 30%        |
| Two Wheeler                      | 296,468          | 24%        | 666,685          | 29%        |
| Auto Rickshaw                    | 96,655           | 8%         | 114,946          | 5%         |

|-------------------------|-----|-----|
| NO <sub>x</sub> Per Day | 323 | 768 |
| CO Per Day              | 198 | 464 |

### 8. Sustainable Urban Transport Scenarios

As shown in the earlier section, the BAU scenario results in increased private trips and decreased Public Transport trips. As per the Ministry of Housing and Urban Affairs guidelines, a sustainable scenario has to be considered to reduce congestion and pollution, while conserving resources like urban space and capital expenditure. Hence, a strategic framework has been developed for the CMP vision of “efficient and sustainable transport for all”

### 9. Strategic Framework for the Scenarios

- **Strategy 1: Expand reach and augment capacity of public transport systems**

The high share of public transport usage in the past has experienced a significant decline in recent decades due to lowering of speed of busses in view of the congestion caused by private vehicles, and aging and overburdened fleet of busses. The areas of operations of existing public transport systems, both road-based and rail-based, should be expanded throughout the city to provide convenient mobility options for commuters. At the same time, capacity of existing systems should also be expanded to provide frequent and reliable transit services for commuters during peak and off-peak hours.

- **Strategy 2: Improve operational efficiency of public transport systems**

While the creation of infrastructure and capacity of public transport is critical, these systems also need to achieve operational efficiency to enhance commuter convenience and to optimize throughput. Bengaluru Metro has high potential capacity for throughput and BMTc can optimize the frequency of services on time performance to provide more reliable services to commuters. Upgradation of the aging bus fleet and driver training, ITS system for data-driven decision making and route rationalisation exercises on a periodic basis will ensure viability and operational efficiency.

- **Strategy 3: Promote multi-modal mobility options**

As urban mobility in the city has experienced a shift towards greater personal vehicle ownership and usage, it is necessary to arrest this trend and achieve more efficient, sustainable and equitable mobility by building a multi-modal transport system that provides integrated, seamless and safe mobility. This requires infrastructure investments that go beyond road networks for vehicles and include investments in public transport, NMT networks, and rail-based infrastructure.

- **Strategy 4: Promote Transit Oriented Development**

A strategic goal of bringing at least 25% area of BMA under Transit-oriented development (TOD) is recommended. The TOD would bring together the closely-related urban planning and transport planning sectors, which are currently governed in silos, for facilitating development, including redevelopment of existing areas,

through a mix of residential, commercial and recreational land-uses in dense and walkable layouts that are centred around high-quality mass transit networks. Other land use related policies such as mixed land use, job decentralization and urban compaction were analysed for sustainable goals.

- **Strategy 5: Improve efficiency of road infrastructure**

A large part of the capacity of the road network in the city is blocked in unproductive and inefficient usage, due to improper planning as well as unregulated behaviours. Parking is a key problem. Other factors impacting the throughput efficiency of urban roads include the design of cross roads and junctions. For efficient road networks that work at full capacity and improve the management of traffic flows, it is necessary to free up road space from unproductive uses and enhance throughput of the road infrastructure.

- **Strategy 6: Augment capacity of road infrastructure**

In addition to inefficient use of road infrastructure, the overall capacity of the road network is also a major constraint. There is a need for augmenting the capacity of arterial roads in the CBD areas, as well as that of the ORR. Planned road infrastructures in the rapidly developing peripheral areas such as Whitefield are also necessary for more equitable road densities across the city. All further augmentation of urban road capacity, be it at-grade or along elevated corridors, should pay particular attention to the equitable allocation of road space, and should prioritize movements of public transport vehicles, pedestrians and bicyclists.

- **Strategy 7: Make commuters bear full cost of externalities of mobility modes**

There are several negative externalities attributed to low-occupancy transport modes such as personal vehicles and certain IPT modes that contribute to increased vehicle kilometres travelled and fuel consumed, With the current laissez faire approach to regulating the usage of inefficient transport modes, the costs of the resulting negative externalities are not borne by the users themselves and also costs fall disproportionately on commuters. Based on the principles of fairness and polluter-pays, a new approach is needed which imposes the full costs of negative externalities of given modes on their users in a proportionate manner, to mitigate their impacts on the city and influence more efficient mode choices.

- **Strategy 8: Influence mobility choice through regulatory, fiscal and pricing measures**

Individuals choose to fulfil their mobility needs using a wide variety of transport modes ranging from single-occupancy personal vehicles to high-occupancy public transport services. These mode choices are often shaped by the regulatory and fiscal framework governing the urban transport system, which has traditionally favoured car-based personal transport. However, the goal of mobility systems should be the efficient movement of people and not that of vehicles, and the governance of the urban transport sector needs to evolve to reflect this objective. Regulatory, fiscal and pricing instruments should be designed to restructure the incentives and disincentives that influence commuter mode choices, with efficient and sustainable modes being favoured and prioritised over inefficient ones.

▪ **Strategy 9: Promoting use of electric and cleaner fuel vehicles**

In spite of favourable climatic conditions, air pollution caused by transport vehicles is becoming a major challenge as the incremental pollution load in Bengaluru is assessed to be the third-highest among all major cities in the country. While the case of e-vehicles, when charged by electricity generated from fossil fuel, in mitigating overall greenhouse gas emissions is debatable, those vehicles certainly can help in mitigating air pollution in a big manner in the city. The strategic intervention should be to set-up measures for increasing use of e-vehicles and CNG vehicles and appropriate electricity pricing for charging of e-vehicles at homes through smart meters.

▪ **Strategy 10: Establish mechanism for planning, capacity building and accountability**

Fragmentation in the governance of urban transport leads to conflicting objectives, and inequitable distribution of transport investments. The establishment of a single organization at the city level is necessary for integrated planning of mobility infrastructure, coordination among different public agencies responsible for mobility services, capacity building in transit agencies for optimization of mobility services, development of a framework for accountability of those agencies, advisory role to State Government for regulatory functions, and the setting up of infrastructure common to different service providers for greater multi-modal integration. Such an organisation should have a legislative mandate and its scope should be wider than being merely advisory.

**10. Options for Sustainable Urban Transport**

**Option 1: Public Transport Augmentation and Efficiency Improvement, and Multi-modal Transport (Strategy 1, 2 & 3)**

This scenario is premised on augmenting reach and capacity of public transport system, mainly from the projects already on the approval or planning stage and taking measures for multi-modal transport options through commuter rail, expansion of metro network along outer ring road and radial roads, and bus fleet augmentation.

The Model was run for this option and the PT Share showed an improvement to 59%. However, the street network continued to show distress as the vehicles would nearly double to what is there today. As a result, first and last mile connectivity would continue to be problematic.

**Forecast Modal Share (Option 1)**

| Modes            | BAU (2031)       |            | Option 1         |            |
|------------------|------------------|------------|------------------|------------|
|                  | Peak Hour Trips  | Mode Share | Peak Hour Trips  | Mode Share |
| Car+Taxi         | 689,673          | 30%        | 572,638          | 25%        |
| Two Wheeler      | 666,685          | 29%        | 304,780          | 13%        |
| Auto Rickshaw    | 114,946          | 5%         | 71,406           | 3%         |
| Public Transport | 827,608          | 36%        | 1,350,088        | 59%        |
| <b>Total</b>     | <b>2,298,912</b> |            | <b>2,298,912</b> |            |

**Option 2: Public Transport Augmentation plus Enhanced capacity and Efficiency of Road Infrastructure (Strategy 1 to 3 and 6)**

This scenario envisages improving efficiency of existing road infrastructure and augmenting the road capacity through junction improvements and smoothening bottlenecks, at-grade road widening and elevated roads while earmarking a part of the new capacity for bus-based public transport besides more ambitious expansion of the public transport.

**Forecast Modal Share (Option 2)**

| Modes            | BAU (2031)       |            | Option 2         |            |
|------------------|------------------|------------|------------------|------------|
|                  | Peak Hour Trips  | Mode Share | Peak Hour Trips  | Mode Share |
| Car+Taxi         | 689,673          | 30%        | 532,581          | 23%        |
| Two Wheeler      | 666,685          | 29%        | 261,240          | 11%        |
| Auto Rickshaw    | 114,946          | 5%         | 67,922           | 3%         |
| Public Transport | 827,608          | 36%        | 1,437,168        | 63%        |
| <b>Total</b>     | <b>2,298,912</b> |            | <b>2,298,912</b> |            |

**Option 3: Comprehensive Mobility Strategy: Transit Oriented Development, Factoring-in full cost of externalities, Regulations on private vehicles, besides Public Transport Augmentation plus Enhanced Capacity and Efficiency of Road Infrastructure, and Cleaner technology vehicles (Strategy 1 to 10)**

The scenario is premised on all future developments and redevelopments being guided by Transit Oriented Development so that the residents live and work closer to high capacity and efficient public transit corridors reducing the demand for long-distance mobility. By imposing the cost of negative externalities, largely through economic means, on the commuters opting for less efficient transport options, the usage of private vehicles is envisaged to be discouraged significantly and thereby regaining the road infrastructure as public good. While these two measures influence the demand, the supply side is to be taken care by expansion and improve efficiency of public transport systems and methodical efforts for multi-modal integration measures.

**Forecast Modal Share (Option 3)**

| Modes            | BAU (2031)       |            | Option 3         |            |
|------------------|------------------|------------|------------------|------------|
|                  | Peak Hour Trips  | Mode Share | Peak Hour Trips  | Mode Share |
| Car+Taxi         | 689,673          | 30%        | 394,472          | 17%        |
| Two Wheeler      | 666,685          | 29%        | 181,126          | 8%         |
| Auto Rickshaw    | 114,946          | 5%         | 42,669           | 2%         |
| Public Transport | 827,608          | 36%        | 1,680,644        | 73%        |
| <b>Total</b>     | <b>2,298,912</b> |            | <b>2,298,912</b> |            |

**Comparison of Emissions (in Tonnes)**

| Emissions in Tonnes     | Base Year (2015) | BAU (2031) | Option 3 |                   |       |                                       |
|-------------------------|------------------|------------|----------|-------------------|-------|---------------------------------------|
|                         |                  |            | Option 2 | Demand Management | NMT   | All Buses and Cars Run on Electricity |
| CO <sub>2</sub> Per Day | 29204            | 69062      | 17880    | 16092             | 12874 | 6437                                  |
| HC Per Day              | 51               | 126        | 28       | 25                | 20    | 10                                    |
| SPM Per Day             | 9                | 24         | 7        | 6                 | 5     | 3                                     |
| NO <sub>x</sub> Per Day | 323              | 768        | 173      | 156               | 125   | 62                                    |
| CO Per Day              | 198              | 464        | 120      | 108               | 86    | 43                                    |

**11. Development of Comprehensive Mobility Plan**

The comprehensive mobility plan covering first ten strategies recommended as part of Option 3 in the previous section has been arranged in following twelve themes under which projects have been identified:

**Theme 1: Integrated Land Use and Mobility Plan**

- **Transit Oriented Development**

A draft TOD policy has been prepared and placed in the public domain for suggestions. The policy envisages the vision of "Bengaluru becoming a public transport oriented city that is compact, people friendly, environment friendly and support economic growth while offering a good quality of life. The goals of the policy are aligned to that of the CMP with the major goals being achievement of 70% share of public transport in motorized trips and 60% of the city population living within intense TOD zone. The policy assesses that the goals may require about 600 km of mass transit corridors and development of adequate infrastructure so as to achieve the gross density ranging from 250 to 400 pph (persons per hectare) along the mass transit corridors by 2031. The major components of TOD framework are density, diversity, design, destination accessibility, distance to transit and demand management. The required changes to the Revised Master Plan 2031 should be made to align with the TOD policy.

**Theme 2: Public Transport Improvement Plan**

- **Rail-based Public Transport**

The CMP envisages setting up 317 km metro rail network by 2031. In addition, four corridors of suburban rail with a length of 149 km within the city on dedicated tracks and their 165 km extension to suburban areas through tracks shared with the railways are suggested as part of this CMP.

- **Road-based Public Transport**

11 corridors with high demand have been identified as priority corridors (202 kms) with exclusive lanes for public transport buses. The bus fleet size is proposed to be expanded to 16582 by 2031. 40 new depots and TTMC/Bus Terminals have been

identified within the newly planned areas of BMA. The BRTS or Metrolite system has been suggested for Peripheral Ring Road (PRR) and NICE Road.

- **Intermediate Para Transit and New mobility**

Regulation of these services should strive to maximize their contribution to mobility in the city while at the same time minimizing their negative externalities. The IPT infrastructure should be provided and integrated with the road network, PT station areas, FoBs and walkways access points and at designated locations near major activity centers and residential areas.

### Theme 3: Road Network Development Plan

- **Corridor Improvement Plan**

14 corridors with length of 220 kms are proposed for improving the throughput capacity with a view to facilitate better speed for public transport and convenience for NMT.

- **Junction improvements**

50 junctions are proposed for improvements through combination of closure of medians at certain intersections, prohibition of free right turns, provision of adequate sight distance, adequate corner radii, sufficient turning radii, channelizers/division islands, flaring approaches towards intersections, pedestrian and cyclist crossing facilities and signs/lane-markings/lighting and relocating bus stops away from the junctions.

- **Foot over Bridges/ Walkways**

FOBs are proposed at 154 locations to facilitate safe and efficient movement of pedestrians.

- **Capacity Augmentation of Major Junctions / Sections:**

Capacity augmentation of Hebbal junction by construction of additional 3 lane flyover from city to airport and from airport to city and underpass from Tumkur to KR Puram , KR Puram – Tin Factory – Benniganahalli section of ORR –OMR by at grade widening of road, multi modal integration infrastructure and additional flyover loops across railway tracks, and CSB Junction by constructing 2+2 lane subways and service roads is proposed.

- **Widening of Roads**

192 kms of major roads are proposed for capacity augmentation by at-grade widening to uniform 6 lanes through Transferrable Development Rights (TDR) and TOD incentives.

- **Elevated Road Corridors**

92 kms of arterial roads have been proposed for elevated road designed with prioritizing movement of public transport vehicles, regulation on private vehicles and facilitation of inter-modal mobility. The north south corridor and the central ring corridor of the elevated roads require a more rigorous study to confirm the feasibility

with reference to alternate modes including metrolite (elevated) and impact on the traffic flow.

- **Peripheral Ring Road**

Peripheral Ring Road of 78 km length and 80-meter width is proposed on the north-west periphery of the city with complementary connectivity to NICE Road on the south-east periphery and provision in the middle for BRTS or traction guided at-grade Metrolite. The entire road should be access-controlled, signal free, elevated U & right turns. In addition, the area of 2 km width on either side should be developed following TOD norms.

- **Parking infrastructure**

Apart from refurbishing the existing off-street parking lots, development of 50 new parking lots within the core area is proposed.

#### **Theme 4: Non-Motorized Transport Plan**

- **Footpath, Cycle Track and Tender Sure Roads**

974 kms of footpath are proposed to be constructed with 600 kms of cycle track and 103 kms of Tender Sure Roads.

- **Public Bicycle Sharing**

550 hubs have been identified for public bicycle sharing.

- **Pedestrian only streets**

8 streets having significantly pedestrian and commercial establishment are recommended to be declared as pedestrian only streets on Saturday, Sunday, other holidays and special days.

#### **Theme 5: Multi-Modal Mobility Plan**

- **Elevated walkways connecting public transport stations**

Elevated walkways of 300 meter to 1500 meter are proposed at 10 locations to provide better connectivity between metro, railway and bus stations.

- **Inter-modal Interchange Hubs**

32 intermodal interchange stations have been proposed where intersection of two or more public transit corridors is envisaged

- **Multi-modal mobility fare system**

National Common Mobility Card is proposed to be the primary mode of fare system of public transport operators, intermediate para-transit operators, and parking stations in the city

- **Inter-City Mobility**

A total of six intra and inter-state bus terminals are proposed on Tumkur Road, Mysore Road, Old Madras Road, Hosur Road, Bellary Road and Magadi Road so that intercity traffic will not get mixed with the city traffic. These terminals will cater to KSRTC as well as private busses plying from neighboring states. 85 Depots/terminals

are proposed for extended BMTC bus operations and 4 existing terminals are proposed for redevelopment.

## **Theme 6: Private Transport Management Plan**

Proof of parking for vehicle ownership, congestion fee to mitigate negative externalities, strengthening PUC checks and penalties on polluting vehicles, insurance premium based on usage, enforcement norms for safety are major proposals for private transport management.

## **Theme 7: Freight Movement Plan**

High-volume freight deliveries & truck movements to market areas are to be restricted to night-time or off-peak hours. Eight freight logistic centers are proposed at locations close to intersections of PRR and NICE road with arterial roads of the city.

## **Theme 8: Technological Measures**

Smart signalling at intersections, Integrated Command Control Centre, adoption of CNG and electric for IPT vehicles and public transport buses respectively are technological measures suggested for better traffic management and reduction in CO<sub>2</sub> emissions.

## **Theme 9: Travel Demand Management Plan**

The proposed TDM strategies are road space reallocation aiming to re-balance provision between private cars and other sustainable modes, road space rationing by restricting travel at certain times and places, car parking controls and pricing, parking strategies, flexi-time work schedules with employers to reduce congestion at peak times, workplace travel plans, introducing active trip reduction programs, and public education and awareness programs.

## **Theme 10: Regulatory Measures**

The proposed regulatory measures are permit conditions and number of permits for different mobility services, linking new registrations to self-owned or rented parking space, fare regulations, vehicle specifications for fuel consumption and emission levels, vehicle testing and maintenance standards, speed and other safety regulations, data sharing standards and integrated planning requirements- all comprise different tools available to the state regulator for providing access to safe and sustainable mobility for the maximum number of people.

## **Theme 11: Governance Measures**

The governance measures include strengthening of BMLTA as an Authority with statutory powers, enabling integration of the city bus services with the rail-based metro and suburban train networks for seamless transit connectivity and capacity building for data-driven decision making and integrated planning among transit agencies and the BMLTA are the recommended measures.

**Theme 12: Fiscal Measures**

The proposed fiscal measures include dynamic pricing for infrastructure usage, cess on tax on fuel, linking motor vehicle tax to fuel efficiency, friendlier tax environment on inputs and revenues for public transport operators, annual renewal for vehicle registration that is linked to pollution emission and fuel efficiency, and value capture financing of public transport through transit oriented development measures, etc.

**12. Implementation Plan**

The implementation plan provides prioritization of proposed projects and various financial options to be looked at towards implementing the proposed projects. A proper Institutional Frame Work is of utmost importance for the successful implementation and monitoring of all the schemes. In this regard, an Institutional set up is also recommended.

**13. Prioritization of Projects**

The CMP shall be implemented in phases. The phasing of projects has been carried out on the basis of the city needs and readiness of the city for implementing the proposed projects. The phases are defined as follows:

- Phase 1 indicates projects that would be taken up from 2020 to 2022
- Phase 2 indicates projects that would be taken up from 2023 to 2027
- Phase 3 indicates projects that would be taken up from 2028 to 2035

Accordingly, projects prioritized in phase 1, 2 and 3 proposals for Bangalore are shown in Tables below:

**Phase 1 Projects and Cost**

| SN | Projects                             | Unit | Quantity | Rates (Rs in crore) | Total Cost (Rs in crore) |
|----|--------------------------------------|------|----------|---------------------|--------------------------|
| 1  | Metro Rail                           | Km   | 58       | 275                 | 15,950                   |
| 2  | Sub-urban Rail - Shared Track        | Km   | 28       | 10                  | 280                      |
| 3  | Sub-urban Rail - Dedicated Track     | Km   | 46       | 126                 | 5,781                    |
| 4  | Bus priority corridors               | Km   | 54       | 5                   | 270                      |
| 5  | Bus fleet (augmentation/replacement) | Nos  | 4,250    | 0.7                 | 3,000                    |
| 6  | Corridor improvements                | Km   | 50       | 30                  | 1,500                    |

| Phase-2 Projects                     | <b>68,954</b>     |
| Phase-3 Projects                     | <b>1,22,466</b>   |
| <b>Total CMP Implementation Cost</b> | <b>2,30,366</b>   |

**14. Funding of Projects**

The mobility infrastructure being public good, the bulk of the investment funding has to come from fiscal resources. However, the same can be complemented by appropriate levies on commuters and residents in general based on their mobility choices and on economic transactions in Bengaluru having implications on the mobility.

- **Fiscal Resources** from Government of Karnataka and Government of India.
- **Additional Resource Mobilization (ARM)** from Land Value Capture, Parking Fee, Congestion Fee, Revenues from advertisement on public transport infrastructure, Public-Private Partnership with Corporate for metro station naming rights and direct access, TOD at metro stations and depots and Roof-top solar power plants at metro stations and depots and cess of state taxes.
- **Levy of cess and surcharge under Section 18A of Karnataka Town and Country Planning (KTCP) Act, 1961:** Such levy to be imposed while granting permission for development of land and buildings should be used for augmenting water supply and sewer systems, construction of PRR and widening of arterial roads, establishing mass rapid transit systems and improving slums.
- **Bengaluru Infrastructure Fund (BIF):** The proceeds of levy under section 18-A of KTCP Act, and select ARM's like land value capture through premium FAR,

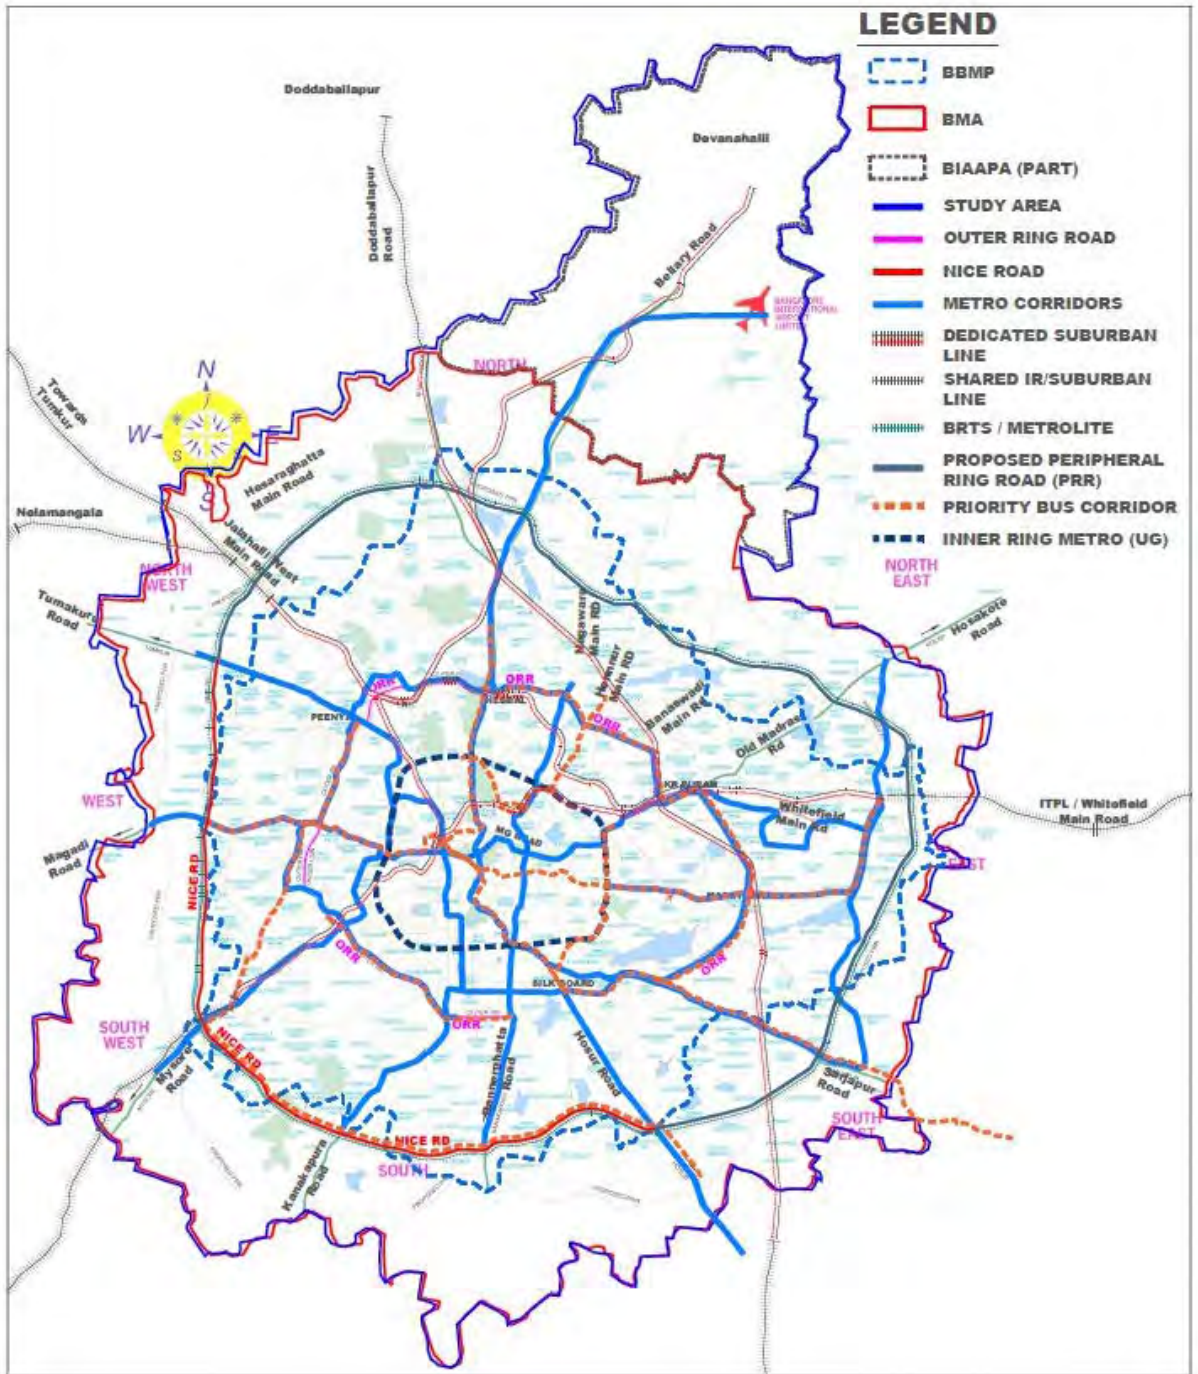

congestion fee, mobility related cess on state taxes should be managed through Bengaluru Infrastructure Fund to be maintained in Public Account of the State Government and managed by BMLTA. The funding from State Urban Transport Fund (SUTF) should complement BIF resources.

- **Funding from local and parastatal bodies: Resources of municipal body (BBMP), planning body (BDA) and parastatal bodies (BWSSB, BESCOM, BMRCL, BMTC, etc.) should be augmented through periodic revisions in their taxes, fees and user charges. Such resources complemented by their borrowings from the financial market should be ploughed-in for implementation of CMP.**
- **Public Private Partnership (PPP):** Projects like development of bus terminals, logistic hubs, truck terminals, parking infrastructure, dedicated suburban rail and select metro rail projects, either as a whole or on unbundled asset class basis, etc. can be implemented through PPP.
- **Transferable Development Rights (TDR):** TDR scheme should be the primary mode for funding the lands required for widening of the roads. An electronic platform for trading of TDR should be established.
- **Monetization of Land Assets: Monetization of land assets of local and planning bodies and parastatal organizations should be taken up to mobilize funds for their infrastructure projects.**

## 15. Monitoring of CMP

An efficient monitoring system for the implementation of development in an integrated manner would be required for the success of the any implementation plan. It is therefore important to have one unified authority, which can stitch all the various agencies involved in the development of city, and ensure the overall objectives and development goals are met. Bengaluru Metropolitan Land Transport Authority (BMLTA) with legislative mandate and served by the existing Directorate of Land Transport (DULT) has been suggested as unified transport authority for regulation of the developments, operations, maintenance, monitoring, supervision and provision of urban transport with Bengaluru mobility area. A design and monitoring framework (DMF) has been suggested for monitoring of individual project.

This document should be treated as a dynamic document for meeting the evolving needs of the city. Its revision can be taken up as and when required, and on periodic basis not exceeding five years.

Public Transport Corridors

## 1 INTRODUCTION

Bengaluru, an early cosmopolitan city in the country and the capital city of Karnataka, is one of the fastest growing cities in India. Bengaluru City is more prominently known as the 'Silicon Valley of India' for spearheading the growth of Information and Communication Technology (ICT) based industries. Bengaluru has become a cosmopolitan city attracting people and business alike, within India and internationally and has become a symbol of India's integration with the global economy.

Bengaluru is the fifth largest metropolis in India, with a total population of 8.5 Million (Bengaluru Urban Agglomeration) as per Census 2011. Bengaluru was the fastest-growing Indian metropolis after Delhi between 1991 and 2001, with a growth rate of 38% during the decade and now is the fastest growing metropolis between 2001 and 2011 with a growth rate of 49.4%.

Development of IT/ITES industries, large public sector undertakings like BEL, BEML and HAL, along with major hardware and garment industries has led to in-migration and rapid growth of the city.

Bengaluru, with its strong economic base, contributes about 36%<sup>1</sup> to Karnataka's GSDP (2016-17). Bengaluru has the highest contribution in secondary and tertiary sector's GSDP due to high concentration of major industries and infrastructure facilities. The Metropolis houses about 40% of urban population of Karnataka and has witnessed 49.4% growth in population during the decade 2001-2011, thus playing the role of a primate city in the State. In context of the State, the Population in the city of Bengaluru accounts for nearly 14.6% of the state's population concentrated in only about 0.64% of the land area.

The number of registered vehicles has crossed 80 lakhs, an increase of 20 lakhs in the past 3 years. Various schemes to rid Bengaluru of its traffic problems are being considered but these are not being implemented in a coordinated manner.

The growing population, vehicle numbers and economic activities, have seriously aggravated the traffic problems in Bengaluru. The limited road space of Bengaluru is not able to handle the current traffic generated by the ever burgeoning population. Consequently, traffic in Bengaluru has become a scourge and is only worsening day by day. Network speeds are dropping at an alarming rate as capacity of the Junctions and links have exceeded the limits. These have contributed towards increasing traffic congestion, travel times and pollution levels.

In view of this, in order to have a coordinated effort to improve mobility in the city, a comprehensive mobility plan integrating various transport infrastructures addressing the needs of various segments of population becomes critically relevant.

The Directorate of Urban Land Transport (DULT), established in line with the recommendations of NUTP 2006, which is secretariat to BMLTA (UMTA for Bengaluru) along with BMRC has prepared this CMP.

This document should be treated as a dynamic document for meeting the evolving needs of the city. Its revision can be taken up as and when required, and on periodic basis not exceeding five years.

---

<sup>1</sup> Economic Survey of Karnataka 2018-19

## 1.1 Sustainable Mobility Principles

### 1.1.1 Access

#### Principle 1: Accessibility

Accessibility to people, places, goods and services is important to the social and economic sustainability

Strategies to manage this is through

- a) Demand Management: Reduce the need for travel while protecting social and economic needs for access through careful planning of urban form, promoting and adopting new communication technologies etc.
- b) Diversifying Options: Improve accessibility through cost effective and efficient transportation options giving people more choices as to how they meet their access needs.

### 1.1.2 People and Communities

Transportation systems are critical elements for a strong economy, which can also contribute directly to building community and enhancing quality of life. The mobility principles around people and community are:

#### Principle 2: Equity

Ensure basic transportation related needs of all people including women, the poor and the differently abled are met and treated with equal importance

#### Principle 3: Health and Safety

Transportation systems should be designed and operated in a way that protects the health (physical, mental and social well-being), safety of all people and enhances the quality of life

#### Principle 4: Responsibility

People and the community have a responsibility to act as stewards of the natural environment, undertaking to make sustainable choices with regard to personal movement and consumption of resources. The proposed systems should be in a position to encourage people towards this.

#### Principle 5: Integrated Planning

Pursue integrated approaches to planning

A strategy to manage this is through Urban and Transportation Planning:

- a) Compact City form, through urban structure and land use policies and promote nodes with sustained mix of land use. This would reduce demand (especially for vehicular trips) by moving origins and destinations closer and also help reduce habitat destruction and loss of agricultural and recreational lands.

- b) Priority for less polluting, lower impact modes of transportation in the design of urban areas and transportation systems. Pedestrian and cycling paths should be provided as attractive and safe alternatives to private transport
- c) Integration of transport modes, whether for passengers or goods, in order to provide more efficient movement and to increase the availability of lower impact transportation options such as public transit; and
- d) Protect historical sites and archaeological resources, reduce noise pollution with due consideration to aesthetics in the planning, design and construction of transportation systems

### 1.1.3 Environmental Quality

#### Principle 6: Pollution Prevention

Transportation needs must be met without generating emissions that threaten public health, global climate, biological diversity or the integrity of essential ecological processes.

#### Principle 7: Land and Resource Use

Efficient use of land and other natural resources to be ensured to preserve environment and vital habitats

Strategies to manage Environmental Quality:

- a) Encouraging use of less polluting transportation systems and modes
- b) Emphasize compact urban form in order to reduce habitat destruction and loss of agricultural and recreational lands around urban areas
- c) Integrate recreational spaces with natural habitat existing to protect environment
- d) Reduce fossil fuel consumption and emissions through improved efficiency and demand management
- e) Promote the use of alternative and renewable energy

### 1.1.4 Economic Viability

#### Principle 8: Fuller cost accounting

Fuller cost accounting to reflect the true social, economic and environmental costs, in order to ensure user pays their equitable share of costs

Strategies under consideration:

- a) Identify and recognize public subsidies (hidden or otherwise) to all modes of transport and make transportation decisions accordingly;
- b) Reflect the full social, economic and environmental costs (including long term costs) of each mode of transport in the assessment;
- c) Ensure users pay share of all costs with due consideration to equity concerns;
- d) Promote research and development of innovative alternative technologies that improve access and help protect the environment; and
- e) Emphasis on providing a wide range of transportation options

## 1.2 Impact of Regional/National Framework

The Comprehensive Mobility Plans (CMP) need to be in cognizance with the national and regional frameworks and guidelines to enhance mobility, promote pedestrians and traffic safety. The existing national policy framework has been considered for framing the strategies for Bengaluru.

### 1.2.1 National Framework

Comprehensive Mobility Plan for Bengaluru Metropolitan Area has been carried out in accordance with the National Urban Transport Policy Guidelines suggested by the Ministry of Housing and Urban Affairs (MoHUA). Accordingly, the focus is on the following:

1. Focus on the mobility of people rather than that of vehicles
2. Focus on improvement and promotion of Public Transport, NMVs and pedestrians as important city transport modes
3. Focus on integrating Land use and Transport Planning
4. Recommend an urban transport strategy that is in line with the National Urban Transport Policy (NUTP)

Thus, considering the overall traffic and transportation related perspectives, both regional and national level guidelines and approaches have been gaining momentum for promotion of sustainable urban transport framework for 30-year horizon period.

The other documents that have been referred to that provide frameworks, guidelines and macro-level action plans to achieve sustainable transportation and mobility in the City include:

#### ***NATIONAL MISSION ON SUSTAINABLE HABITAT***

Under the National Action Plan for Climate Change, the National Mission on Sustainable Habitat has been launched to cover various aspects which inter alia include better urban planning and modal shift to public transport. Regarding Urban Transport, **the objectives of the National Mission on Sustainable Habitat (NMSH) are** "To address the issue of mitigating climate change by taking appropriate action with respect to the transport sector such as evolving integrated land use and transportation plans, achieving a modal shift from private to public mode of transportation, encouraging the use of non-motorized transport, improving fuel efficiency, and encouraging use of alternate fuels, etc. To evolve strategies for adaptation in terms of realignment and relocation, design standards and planning for roads, rail and other infrastructure to cope with warming and climate change".

Accordingly, NMSH postulated 8 principles for sustainable urban transport planning:

- Walk: Develop neighborhoods that promote walking.
- Cycle: Prioritize cycle networks.
- Connect: Create dense networks of streets and paths.
- Transit: Support high quality transit.
- Density, Diversity and Compactness: Optimize density and match transit capacity; Create compact regions with short commutes.

- Shift: Shift from unsustainable mobility to sustainable modes by using technology, regulating road use, parking and fiscal measures.
- Urban Transport Fund: Institutionalise fiscal and funding mechanisms to ensure financial sustainability of investments in public transport and non-motorised transport.
- Impact Assessment: Evaluation and assessment measures to effectively measure impacts of urban transport policies and projects.

## ***METRO RAIL POLICY 2017***

Metro rail projects provide high capacity public transit and are capital intensive. It is in this context that the need for a policy on metro rail is necessary to ensure that such systems are proposed, appraised and decided upon in a comprehensive manner and implemented in the most sustainable manner from the social, economic and environmental perspectives.

The Union Cabinet approved the Metro Rail Policy in August 2017. The following are some of the salient features of the 2017 policy:

- Recognition of the fast-growing need for improvements in the public transport system in a large number of cities
- Evaluation of various options of Mass Rapid Transit Systems (MRTS), along with a comparative analysis of alternate modes of transport to be a vital part
- Metro Rail system is often considered the most suitable urban transport system due to high capacity and speed, along with comfort
- Comprehensive Mobility Plan (CMP) a pre-requisite for planning metro rail systems in any city
- Integration of suburban systems with the proposed metro rail
- The Economic Internal Rate of Return (EIRR) of 14% and above essential requirement for sanctioning of metro rail, since metro rail projects have significant economic and social benefits
- Feeder systems up to a catchment area of 5 km of each metro station, and last mile connectivity to be included in metro rail project proposals
- Increased focus on maximizing non-fare box revenue and revenue through commercial development at stations and allocated land
- Efforts to be made towards reducing costs of construction and operations, with the aim to standardize sub-systems and components
- Exploration of various PPP models and encouragement for all forms of PPP, whether for full provisioning or for unbundled components
- Appraisal by an independent agency as identified by the Ministry of Housing and Urban Affairs (MoHUA).

## ***National Electric Mobility Mission Plan 2020 (NEMMP)***

In 2013, Government of India introduced the National Electric Mobility Mission Plan 2020 to achieve National fuel security by promoting hybrid and electric vehicles in the country. Government aims to provide fiscal and monetary incentives to kick start this technology. The target is to achieve sales of 6 – 7 million in the hybrid and electric vehicles sector from 2020. Under the NEMMP, the Government has launched the Faster Adoption and Manufacturing of Electric (FAME) vehicles scheme. This scheme is expected to provide a major thrust towards early adoption of electric and hybrid vehicles.

Four focus areas of FAME India include:

- Technology Development
- Demand Creation
- Pilot Projects
- Charging Infrastructure

## 1.2.2 Regional Framework

### Creation of UMTA

Bengaluru's history of multiple (and often competing) transport agencies is a major reason for unsustainable projects being proposed and implemented. To avoid such situations, Bengaluru needs to have a unified agency, a Unified Metropolitan Transport Authority (UMTA), which would have the power to plan, coordinate and facilitate investment in sustainable transport projects. The previous attempt to create a UMTA, called Bangalore Metropolitan Land Transport Authority (BMLTA), was made in 2007. BMLTA was created through an executive order along the lines of Singapore Land Transport Authority (LTA) and is meant to plan the investments in sustainable urban transport systems. The major challenge for BMLTA has been that it had no financial and legislative power to make decisions related to transport planning and limited institutional capacity. Planning and implementation of urban transport still remained with the individual agencies.

For BMLTA to deliver on its full mandate, it needs financial and legislative authority as well as independent professional management. Such an empowered agency would have the power to decide the nature of transport investments for the city. From a financial perspective, the proposed UMTA should be able to fund both operational and capital costs. Mechanisms such as petrol/diesel cess, congestion fees and user charges on cab aggregators can feed into an urban transport fund to cover operational costs. On the other hand, capital costs would require funding from state and central governments.

The Karnataka government has now decided to provide a statutory anchoring to BMLTA and augment its capacity. BMLTA, i.e., the UMTA for Bengaluru, with statutory cover could radically transform the way urban transport is planned and implemented in the city.

### Electric Vehicle Policy

Recognizing the need for more interventions to mitigate transport related pollution, the State of Karnataka has taken an initiative to come up with “**Electric Vehicle and Battery Storage Policy**” (**EV Policy**) for the state in 2017. The EV policy of the state clearly lays a road map for significant conversion of public transport vehicles, freight vehicles and personal motor vehicles to electric by 2030. The policy also identifies and facilitates the infrastructure that would be required to achieve such goals by easing the setup of electric vehicle manufacturing plants, setting of charging units, etc. While the EV conversion, if realized, may significantly reduce the emission pollutants on roads and engine noise pollution from vehicles, much needs to be done to curtail the compounding growth of motorized vehicles on roads to ensure that on-road dust and noise pollution from honking, etc. are under acceptable limits.

## Data Sharing Framework

Urban transport systems are seeing a profusion of data being generated that could significantly improve evidence-based urban and transport planning, and enable unobtrusive enforcement of regulations. Data sets include trip data of modern transport aggregator services and public transport services held with the respective companies or transit agencies; license, vehicle registration and permits data held with the Transport Department; road network, parking, land-use and plot level data held with the BBMP and BDA; traffic violations and accidents data with the BTP. Bringing together these data sets currently held in silos by various public and private agencies, as well as opening up anonymized transport data to the public, can promote integrated mobility planning as well as innovation for the development of better commuter services.

## Citizen Awareness Programs

In addition to promoting sustainable infrastructure in cities, one of the directives of the government of Karnataka is to create greater awareness among public on choices of mode they can opt for commuting (like use of public transport, carpooling, cycling, use of electric vehicles, etc.) and carbon footprints they leave when using different commuting modes, which in the long-term are necessary to bring about behavioural changes in commuters.

### 1.3 National Urban Transportation Policy (NUTP)

There is an urgent need to conserve energy and land, control pollution and 'greenhouse gas emissions', and to alleviate poverty. Urban transport (UT) is a significant cause and also a solution to these issues. The growth story of Urban India is highly depended on planned urban development and sustainable urban mobility solutions. Cities are important as they contribute most to the 'gross domestic product' (GDP) of a country. By 2030 this figure is estimated to grow to about 70%. Urban Transport is a key urban service that imparts efficiency to the city by providing mobility to the workforce and enables them to work at their productive best. Considering this, planning and management of UT services and infrastructure require immediate attention. The vision of NUTP is:

- To recognize that people, occupy center-stage in our cities and all plans would be for their common benefit and well-being;
- To make our cities the most livable in the world and enable them to become the "engines of economic growth" that power India's development in the 21st century;
- To allow our cities to evolve into an urban form that is best suited for the unique geography of their locations and is best placed to support the main social and economic activities that take place in the city; and
- To encourage growth of urban transport along low carbon path

NUTP suggests and encourages plan the urban transportation system for the people rather than vehicles by providing sustainable mobility and accessibility to all citizens to jobs, education, social services and recreation at affordable cost and within reasonable time. The Objectives of NUTP include:

- Integrating urban transportation in to urban/ land-use planning for effectiveness and efficient one of the transportation system

- Proposed transportation system to focus on moving people than vehicles through more equitable allocation of road space
- Integrated Public Transport to cover the entire city for providing safe, seamless, user friendly, reliable service to the people
- Priority to non-motorized transport as Walk and cycle
- Leveraging technology through adoption of Intelligent Transport Systems for an efficient traffic management
- Incorporate adequate measures for improved road safety and trauma response system
- Establishing institutional mechanisms for enhanced coordination in the planning and management of transport systems including establishing UMTA
- Building capacity (institutional and manpower) to plan for sustainable urban transport and establishing knowledge management system

With this in the backdrop, the study has been undertaken and progressed.

## 1.4 Delineation of Planning Area

The study area includes the Bengaluru Metropolitan Area (LPA area) i.e. 1294.00 Sq.km. (including part BMICAPA area – 79.14 Sq.km.) The development of Airport near Devanahalli and transport infrastructure development in the form of 6 lane access controlled road between Hebbal and Airport has triggered development around airport and near Devanahalli. To ensure planned development, BIAA-LPA has been established to oversee the development of the identified area. The BIAA-LPA study area reveals that most of the developments are in two administrative areas namely Jala Hobli and Kasba Hobli. Considering this and to account its impact on the city development part of BIAA-LPA area extending 227.85 Sq.km has been included in the planning area for CMP.

The study area for preparation of Comprehensive Mobility Plan is shown in Figure 1.1.

## 1.5 Vision, Mission and Objectives of the Mobility Plan

### 1.5.1 Vision: Efficient and Sustainable Transportation for All

The vision of the Comprehensive Mobility Plan for Bengaluru is to achieve "Efficient and Sustainable Transportation for All", with a system that serves to help fulfil the economic and social needs of residents and visitors. The achievement of this vision is expected to help mitigate the most significant constraint to the city's role as one of the major economic engines for development of the state and the country.

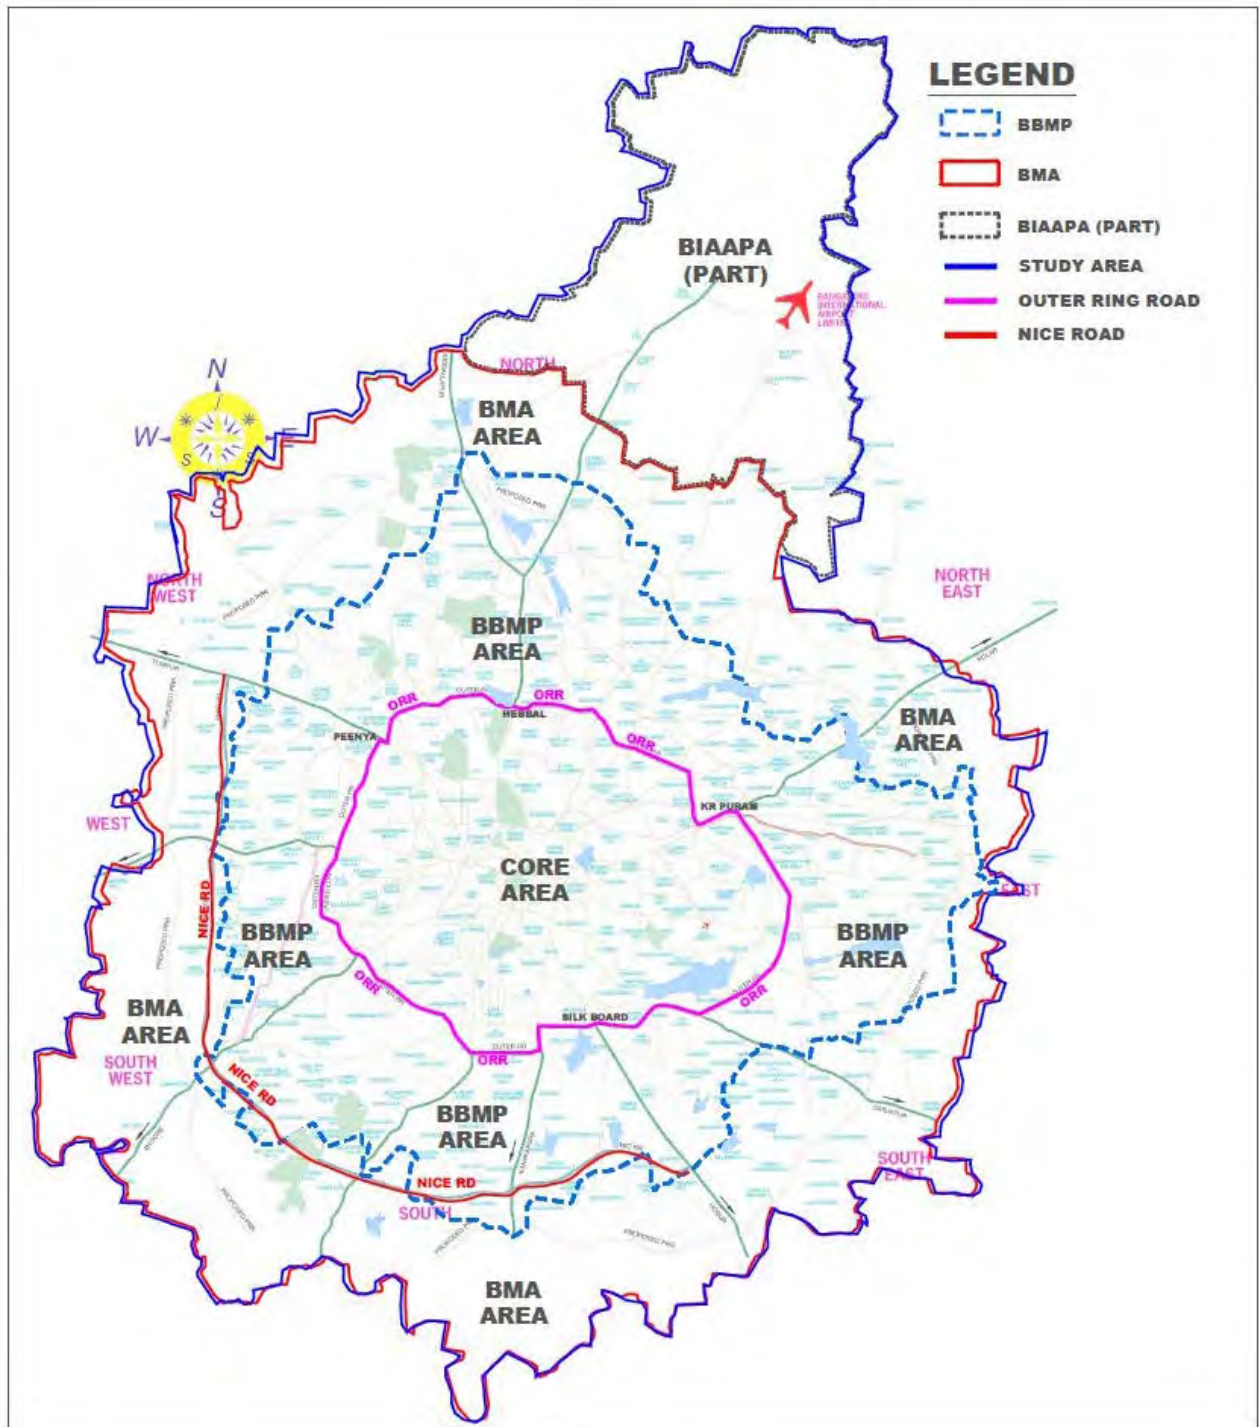

Figure 1-1: CMP Study Area

**1.5.2 Mission: Build a multi-modal transport system for equitable mobility access and minimized negative externalities**

Achieving efficient and sustainable transport for all requires comprehensive data-driven reforms to our existing urban mobility paradigm which favours inefficient and unsustainable modes of transport that provide personal mobility but negatively impact system-wide mobility. There is

a need to build a robust multi-modal transport system that provides options of high-quality, safe and integrated mobility for all users, regardless of income and gender. Further, it is necessary to reduce the negative externalities of the transport sector, by incentivizing sustainable modes of transport and investing in future-proof infrastructure. This mission statement may be further expressed in the form of the following three short-term and medium-term goals or objectives.

**Goal 1: Increase mode share of public transport in meeting transport demand**

Develop public transit system in conformity with the land use that is accessible, efficient and effective. Aim to increase the share of public transport in Bengaluru to at least 60% by 2031 and to 70% beyond that.

**Goal 2: Regain road infrastructure as public good**

Regaining road infrastructure as a public good, which non-excludable and non-rivalrous at all times, should be the primary goal of the comprehensive mobility plan for the city as the road infrastructure is currently skewed in favour of those using their private vehicles, with commuters who are dependent on more efficient and sustainable modes such as NMT and public transport getting excluded from the equitable use of roads and being subjected to the negative externalities imposed by excess private vehicle usage.

**Goal 3: Reduce transport sector contribution to air pollution and GHG emissions**

Reduce the negative externalities imposed by transportation, by regulating transport demand by way of congestion pricing, priced parking system, linking vehicle registration with pollution emission etc., investing in cleaner technologies and prioritizing more sustainable modes of transport.

Aim to reduce the contribution of the transport sector to air pollution and GHG emissions should be reduced by 30 per cent by 2025. By 2031, the target should be to reduce pollution levels by 50 per cent from 2019 levels.

## 1.6 Review of Available Resources

### Earlier Studies

To match with the master plan efforts, comprehensive traffic and transportation plans were prepared to ensure and incorporate road development proposals in line with the population and development projections in Bengaluru City. Below are the major studies conducted earlier in the city.

- ✓ Comprehensive Traffic and Transportation Plan for Bengaluru City, RITES, 2011
- ✓ Comprehensive Traffic and Transportation Study for Bengaluru Metropolitan Region, WSA, 2018
- ✓ Transport Demand Forecast Study and Identification of Phase-III Corridors of Bengaluru Metro, RITES, 2016
- ✓ DPR for Implementation of Bengaluru Suburban Rail System, RITES, 2016
- ✓ Revision of Master Plan 2031 for Bengaluru, BDA
- ✓ Sustainable Transport measures for livable Bengaluru (IISc 2018)

- ✓ The Urban Commute by CSE 2018
- ✓ Parking Policy for Clean Air and Livable Cities (CSE 2016)
- ✓ Sustainable Practices in Other Countries

## **Comprehensive Traffic and Transportation Plan for Bengaluru City (2011)**

The comprehensive transportation study was undertaken by KUIDFC to prepare development plan for the traffic and transportation plan for the Bengaluru City. The Vision of the CTPP was to have efficient, people friendly transport system with minimum travel time and maximum safety and comfort. Elaborate study of travel demand in the city and travel pattern has been used to develop robust multi-modal transportation system for meeting travel needs of the city's population. The major outcome of the study is identification of projects proposals for implementation to address the transportation needs for the short term, medium term and long term.

- Identification of network for the development of mass transport system covering the major corridors of movement in the City and interchange facilities with other modes of transport
- Identify network for development of medium level mass transport system such as BRT to cover the areas beyond the Mass Transit network and act as second level Public Transportation System
- Land use adjustments and densification of corridors along mass transport corridors where possible to best utilize the transportation system as catalyst for development
- Extension of commuter rail system up to the BMRDA's New Townships & beyond up to Tumkur, Hosur etc. to act as sub-urban services.
- Providing transport hubs for Interstate passenger and freight traffic near the junctions of Peripheral Ring Road with important radials such as; the National Highways and other heavily loaded roads.
- Transport integration of various modes.
- Strengthening of existing institutions dealing with various aspects of urban transport and formation of a unified transport authority for inter-agency coordination.

## **Comprehensive Traffic and Transportation Study for Bengaluru Metropolitan Region (2018)**

The Comprehensive Traffic and Transportation Study was undertaken by BMRDA by extending the study area to areas beyond the City and included satellite towns around the City. The vision of the CTTS was to prepare transportation master plan with an aim to provide an efficient transportation system catering to the needs of population in the BMR region. The major outcome of the study is identification of projects proposals for implementation to address the needs for long term, medium term and short term.

### Long Term Proposals

- Development of Multi-Modal Public Transport System
- Development of 341km of Mass transit corridors covering the major corridors of movement in the City and interchange facilities with other modes of transport
- Development of 231km of dedicated high capacity BRTS corridors to cover the areas beyond the Mass Transit network and act as second level Public Transportation System
- Development of intermodal stations for better integration

- Land use adjustments and densification of corridors along mass transport corridors where possible to best utilize the transportation system as catalyst for development
- Extension of commuter rail system up to the BMRDA's New Townships & beyond up to Tumkur, Hosur etc. to act as sub-urban services.
- Providing transport hubs for Interstate passenger and freight traffic near the junctions of Peripheral Ring Road with important radials such as; the National Highways and other heavily loaded roads.
- Transport integration of various modes.
- Strengthening of existing institutions dealing with various aspects of urban transport and formation of a unified transport authority for inter-agency coordination.
- Road Network Improvement Proposals
  - Development of New Roads totaling a length of about 515km
  - Development of Missing Links totaling to about 530km
  - Augmentation of capacity of existing roads

## **Transport Demand Forecast Study and Identification of Phase-III Corridors of Bengaluru Metro**

Transport Demand Forecast Study and Identification of Phase III Corridors of Bengaluru Metro was undertaken by Bengaluru Metro Rail Corporation Limited (BMRCL) to extend the metro system in Phase-III for the areas not covered by Phase-I & II and interconnect the metro system network.

The study area includes the Bengaluru Metropolitan Area (BMA area) i.e. 1306.1 Sqkm. (including part BMICAPA area – 65.31 Sqkm.) and adjoining areas around Bengaluru International Airport Area Local Planning Authority (BIAA-LPA). Adjoining BIAA-LPA area has been included in the study area as public transport corridors are connecting Bengaluru International Airport and some of the localities where proposed development have been listed out in BIAA-LPA Master Plan. Horizon year for the study will be 2041. The effect of traffic coming from outside Bengaluru and using Bengaluru's transport system shall also be taken into account. The major outcome of the study includes:

- Transport Demand Forecast for Phase I & II Corridors of Bengaluru Metro
- Development of Mass Transport Networks
- Development of Alternative Mass Transport Networks
- Evaluation of Alternative Mass Transport Networks
- Transport Demand Forecast for Recommended Mass Transport Network

## **DPR for Suburban Rail System for Bengaluru RITES**

DPR for Suburban Rail System for Bengaluru was undertaken by Indian Railways. Considering the growing pressure on Bengaluru City and to provide impetus to (satellite) towns in the immediate neighbourhood, development of which would ease pressure on the Bengaluru city, a robust high capacity sub-urban rail system has been planned. Accordingly, following sub-urban services are proposed to be implemented in three phases. The proposed sub-urban rail system is expected to run services as below:

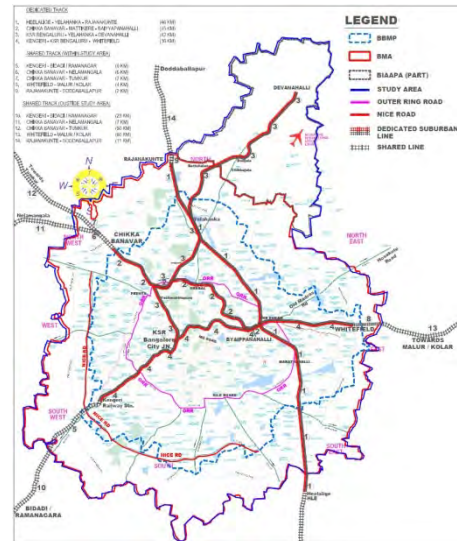

**Table 1-1: Proposed Bengaluru Sub-urban Rail Network**

| Sl. No. | Proposed Corridor             | Approx. length (km) |
|---------|-------------------------------|---------------------|
| 1       | Bengaluru – Mandya            | 92.88               |
| 2       | Bengaluru – Yashvantpur       | 5.35                |
| 3       | Yashwantpur – Tumkur          | 64                  |
| 4       | Yashvantpur – Yelahanka       | 12.45               |
| 5       | Yelahanka – Baiyappanahalli   | 19.23               |
| 6       | Yeshvantpur – Baiyappanahalli | 16.12               |
| 7       | Yelahanka – Dodballapur       | 20.72               |
| 8       | Yelahanka – Chikballapur      | 46.05               |
| 9       | Baiyappanahalli – Hosur       | 48.59               |
| 10      | Bengaluru – Bangarpet         | 70.21               |
| 11      | Soldevanahalli – Kunigal      | 45.2                |

The sub-urban rail network plan has been further modified and the revised plan which is combination of at-grade and elevated sections to minimize land acquisition. The development considered four larger corridors with 57 stations (21 elevated and 36 at ground level) as below:

- Corridor 1: Heelalige to Rajanukunte – 46 km
- Corridor 2: Chikka Banavar to Baiyyappanahalli – 25 km
- Corridor 3: KSR Bengaluru City to Devanahalli – 42 km
- Corridor 4: Kengeri to Whitefield – 36 km

The corridors once developed are expected to cater to about 1 million passengers by 2025 and increasing to about 1.9 million passengers by 2041. The sub-urban network development is expected to cost about INR 18,621 Cr.

**Revision of Master Plan 2031**

Revision of Master Plan 2031 was undertaken by Bengaluru Development Authority to identify attendant issues and challenges inhibiting streamlined growth and development in the BMA and also to understand the present status of RMP 2015 plan implementation and enforcement. Simultaneously several studies and surveys were conducted to formulate the

baseline scenario. This preliminary analysis facilitated demographic projections and associated demand for land, infrastructure and services for the horizon year 2031, which in turn helped in arriving at the master plan scenarios of how the city should grow.

The BDA has endeavored to revise the Master Plan for Bengaluru for 2031 as a spatial-policy framework to guide the future growth of the city especially keeping the aspirations of the citizens.

RMP for Bengaluru-2031 evolved 3 alternative Growth Scenarios namely:

1. Containment Scenario
2. Corridor Driven Scenario
3. Differential Scenario

Following are the key considerations for the conceptualization of options and scenarios for the city:

- Existing Developments and Present Situation
- Regional Growth Direction
- The spatial differentiation and associated growth and development trends as noticed in the different zones of the city: a) Core Area (inside ORR or the erstwhile BMP), b) Outer Core (ORR to BBMP Limits) and c) Transition Area (251 Villages in the BMA)
- Population projections for the city for 2031
- In addition, the growth scenarios adopt following critical non-negotiables
  - Circulation Network (Road Network and Commuter Rail System) with focus on public transport system
  - Green network as consistent with the city's topography
  - Promotion of Public Transport
  - Provision of Affordable Housing

Following are the major transport Projects and Programmes identified by Master Plan for implementation:

- **Road Development Plan:** This includes following component:
  - Demarcation of Master Plan Roads (18m above only) on Ground
  - Upgradation/ Widening of Existing Roads
  - Development of New Links
  - Junction Improvement Programme and Development of Flyovers/ Railway Bridges
  - Preparation of Parking plans for Streets/ Areas
- **Public Transport Network Development:** This includes following component:
  - Development of Commuter Rail Service
  - Development of Metro Network
  - Development of LRT/Mono Rail/ BRTS
  - Development of Intermodal Interchanges
  - Development ISBTs
  - Development of Bus Stations/ Terminals
- **Development of Logistic Facilities:** This includes following components:
  - Demarcation of Land for Logistic Facilities

- Development of Logistic Hubs/ Truck Terminals
- Rejuvenation of Lakes and Streams
- This includes following components
- Prioritise Lakes for Rejuvenation
- Demarcation of Lakes Extent

## **Sustainable Transport Measures for Livable Bengaluru (IISc 2018)**

Sustainable Transport Measures for Livable Bengaluru was undertaken by Transportation Engineering Lab, Department of Civil Engineering, IISc, Bengaluru. The main objectives of the study are:

- Developing mitigation strategies for transportation sector which are aimed at reducing the GHG emissions, local pollutants and traffic congestion from a baseline condition
- Identifying transportation infrastructure that is vulnerable to climate change and assess the impacts of climate change on the transportation infrastructure
- Developing adaption strategies for the base year and horizon years 2030 and 2050 to evaluate the vulnerability, scope and extent, severity of each flood event caused by climate change to transportation sector.
- Improving the overall livability of Bengaluru

## **The Urban Commute CSE 2018**

The report titled 'The Urban Commute and How, it Contributes to Pollution and Energy', compiled by the Centre for Science and Environment (CSE) evaluated fourteen Indian cities [Six megacities (Delhi, Mumbai, Kolkata, Chennai, Bengaluru and Hyderabad) and eight metropolitan cities (Bhopal, Lucknow, Jaipur, Chandigarh, Ahmedabad, Pune, Kochi and Vijayawada)] for emissions caused by urban commuting. The cities were ranked based on how they fare when it comes to pollution and energy consumption from urban commuting.

In the study, with an aggregate of toxic emissions from urban commuting practices, such as particulate matter and nitrogen oxides, the cities were ranked based on calculations of heat trapping (CO<sub>2</sub>). The study took two approaches to rank the cities — one based on overall emission and energy consumption and the other on per person trip emissions and energy consumption. Bengaluru ranked 12 among the 14 cities evaluated.

### **Key Conclusion:**

It is important to combine sustainable mobility strategies with clean vehicle technology and fuels.

## **Parking Policy for Clean Air and Livable Cities (CSE 2016)**

Parking Policy for Clean Air and Livable Cities was undertaken by Centre for Science and Environment. This policy guidance is a primer that lays bare the essential elements of parking policy that can help to decongest as well as reduce pollution and fuel guzzling in cities.

Urban local bodies and urban development departments across Indian cities are now expected to change the focus of parking policy based on principles of restraint. But there is very little policy or public understanding of the key elements and principles that make parking policy and can reduce parking demand and car usage to cut congestion and pollution and ensure climate mitigation.

This document is based on emerging principles from global experiences and practices, literature review and field assessment of local initiatives in cities.

## Sustainable Practices in Other Countries.

- **“Transport and Climate Change – A review” by Lee Chapman** talks about the how the technological and behavioral changes can reduce the fossil fuel consumption and reduction in greenhouse gas emissions.
- **“Estimation of Bus Stops Spacing on Public Transport Routes in Kano Metropolis Using Minibus Stop Time Interval” by Muttaka Na’iya Ibrahim and Yunusa Isma’il** – This paper talks about the inter stop distance between two bus stops and reviews about various inter stop distances used across the world.
- **“Issues in sustainable transportation” by Todd Litman and David Burwell** talks about the problems that arise due to misunderstanding of sustainable transportation system. Misunderstanding the concept of sustainability and setting wrong goals, objectives and improper decision-making process will not favour sustainable transport. This paper also highlights the important indicators that should be considered to assess the city’s level of sustainability.
- **“Transport and climate change: Simulating the options for carbon reduction in London” by Robin Hickman, Olu Ashiru & David Banister** shows the development and simulation of various policies like low emission vehicles, alternative fuels, pricing regimes, public transport, walking and cycling, strategic and local urban planning, information and communication technologies, smarter choices, ecological driving and slower speeds, long distance travel substitution, freight transport and international air. The model helps in setting the level of application of the variable to achieve a desired CO<sub>2</sub> emission target.
- **“Evaluating Transportation Equity: Guidance for Incorporating Distributional Impacts in Transportation Planning” by Todd Litman** explains the importance of equity in transportation system. This work shows various indicators of vertical and horizontal equity which can be evaluated to check if the city’s transport policies are equitable or not. This report is one of the important reports with respect to equity in transportation system.

## 1.7 Stakeholder’s Identification

Identifying the stakeholders and understanding their role in the process is important to achieve the overall goals of Comprehensive Mobility Planning. The Stakeholders involvement helps in understanding other various activities or projects carried out in the city and also helps in improving the planning process in terms of geographical coverage, policy integration, resource availability and overall legitimacy.

There are many stakeholders for urban transport Development and Implementation in Bengaluru.

## *Road Infrastructure*

Bruhat Bengaluru Mahanagara Palike (BBMP), owns the road infrastructure within its jurisdiction covering about 800 sq. km. (i.e. BBMP limits) and are responsible for construction and maintenance of these roads, including Non-motorized transport infrastructure such as footpath, FoBs, etc.

Bengaluru Development Authority (BDA) is principal Planning Authority in Bengaluru which is responsible in preparing Master Plan for Bengaluru Metropolitan Area. BDA was established under Karnataka Town and Country Planning Act of 1961 (KTCPA). It also oversees planning and development of infrastructure, provision of development-related sites and services, the housing needs of underprivileged citizens in Bengaluru and is currently the city's largest land developer. Within Bengaluru (BMA), the PWD manages road network outside the purview of BBMP.

Public Works Department (PWD) is entrusted with the responsibility of maintenance of road works including the National Highways, State Highways and Major District roads in the state of Karnataka

Karnataka Road Development Corporation Limited (KRDCL) is a company under the Public Works, Ports & Inland Water Transport Department. This Company was established to promote road transport infrastructure such as Road Works, Bridges etc., and to improve road network construction, widening and strengthening of roads, construction of bridges, maintenance of roads etc.; KRDCL is also entrusted to take up projects on PPP mode such as BOT, BOOT, and BOLT etc.

## *Urban Mass Transport*

Bengaluru Metro Rail Corporation Limited (BMRCL) is a Special Purpose Vehicle entrusted with the responsibility of planning, designing and implementation of Bengaluru Metro Rail Project in Bengaluru and is a joint venture of Government of India and Government of Karnataka.

BMRCL has completed the first phase of East-West and North-South metro corridor and is currently operational. Phase II is taken up for implementation. Planning of extension of Phase II and Phase III Metro Corridors is underway.

Bengaluru Metropolitan Transport Corporation (BMTCL) is responsible for operations of bus services in the city. BMTCL owns 6634 buses and caters to around 6143 schedules daily in the city. BMTCL has 45 bus depots and 54 bus stations. BMTCL recently started using ITS systems for better operational efficiency of fleet and also rolled out smart cards.

## *Regional Connectivity*

Karnataka State Road Transport Corporation (KSRTC) caters to intra-city (through its subsidiary BMTCL), interstate and intercity bus service for the state of Karnataka. KSRTC services covers 92% villages in Karnataka. KSRTC operates with a total fleet of 23829 buses (KSRTC 8348, NEKRTC-4343, NWKRTC-4716) and BMTCL-6634.

It transports, on an average about 74.6 lakh passengers per day. It also operates to the neighboring states of Maharashtra, Andhra Pradesh, Telangana, Tamil Nadu, Puducherry, Goa and Kerala.

South Western Railway (SWR) was created by amalgamating the re-organized Hubli division from South Central Railway and Bengaluru & Mysore divisions from Southern Railway. It has been operational from 1st April 2003 having the headquarters at Hubli in the state of Karnataka. The Railway comprises of 03 divisions, viz. Hubli, Bengaluru & Mysore and primarily caters to Karnataka state with 84% of its jurisdiction located there.

### *Regulation and Licensing*

Transport Department, is mainly responsible for regulation of the use of Motor Vehicles in the State and collection of tax on Motor Vehicles, Road Safety, Control of Air and Noise pollution in accordance with the provisions of the Motor Vehicles Act 1988 (Central Act 59 of 1988), Central Motor Vehicles Rules, 1989, The Karnataka Motor Vehicles Rules, 1989, The Karnataka Motor Vehicles Taxation Act 1957 (Karnataka Act 35 of 1957), The Karnataka Motor Vehicles Taxation Rules, 1957. Transport Department also houses Road Safety Authority.

### *Enforcement*

Bengaluru Traffic Police (BTP) is responsible for traffic enforcement/management in the city of Bengaluru. BTP manages traffic at junctions (about 44 thousand) and roads (11 thousand kms) including High Density Corridors (HDC) in the city. Traffic police has established a technologically advanced Control center through which it manages accidents, traffic violations and other traffic related situations.

### *Road Safety*

Road Safety Authority is established in Transport department and is the Lead Agency for implementation of all road safety measures in the state in co-ordination with all the concerned stake holding departments viz., Transport, Police, Public Works, Education, Health, Urban Development, National Highway Authority of India, Rural Development and Panchayat Raj, Excise, BBMP, Directorate of Municipal Administration etc.

### *Planning*

Directorate of Urban Land Transport (DULT) is functioning under the Urban Development Department of Government of Karnataka. DULT is mandated to coordinate planning and implementation of all urban transport matters in the State. The directorate has been set up in 2007 by the State Government close on the heels of the National Urban Transport policy.

### *Freight Operators*

Devaraj Urs Truck Terminal Limited is the principal government freight operators apart from Pvt. Operators

### *Other Stakeholders*

- Residents / Commuters
- Industry / Traders
- Academic and Research Institutes

- Taxi Operators
- KSPCB

## 1.8 Approach and Methodology

'Comprehensive Mobility Plan' envisages the Planning Area as a unified city with well-defined integrated multi-modal transportation system catering to all cross-sections of the society. The document is a comprehensive study entailing a series of physical interventions and policies to reinforce the regional connectivity and increase the mobility within the city.

Transportation being the backbone of all urban development activities, inadequately envisioned, or poorly delivered, can stunt growth for city and take capital investment to other cities. Therefore, the mobility plan is not only analytical, but also takes a long term view of the financial implications of the transportation mechanism on the city, including but not limited to the cost of congestion and quality of life and health of the citizens.

The following methodology has been derived to achieve the above mentioned objectives through a series of interrelated tasks in a comprehensive manner:

A brief methodology adopted for preparation of Comprehensive Mobility Plan for Bengaluru is presented below:

| <b>STAGE 1: Defining NEED and SCOPE for Comprehensive Mobility Plan for Bengaluru</b>   |   |  |
|---|---|--|
| <p>Stage 1.1: Establishing Need, Defining Vision &amp; Objectives for Bengaluru</p> <ul style="list-style-type: none"> <li>Review of vision for Bengaluru from Master Plan and Other Economic studies</li> <li>Defining Need for preparation of CMP</li> <li>Defining Vision (in coherence to the vision for Bengaluru from Master plan and other Economic plans)</li> <li>Objectives of CMP for Bengaluru</li> </ul> | <p>Stage 1.2: Delineation of Planning area</p> <ul style="list-style-type: none"> <li>Reconnaissance of Bengaluru Region</li> <li>Delineation of planning area to plan CMP</li> </ul> | <p>Stage 1.3: Defining Planning Horizon</p> <ul style="list-style-type: none"> <li>Short term</li> <li>Long term</li> <li>Medium term</li> </ul> |

| <b>STAGE 2: Existing Situation Analysis &amp; Data Collection</b>  |  |   |
|--|--|---|
| <p>Stage 2.1: Review of existing population characteristics through secondary sources</p> <ul style="list-style-type: none"> <li>Review of Regional Profile</li> <li>Review of land use patterns, characteristics of population, population density</li> <li>Review of Socio economic profile</li> <li>Review of Energy and Environment</li> </ul> | <p>Stage 2.2: Review of existing transport characteristics through secondary sources</p> <ul style="list-style-type: none"> <li>Review of Road infrastructure</li> <li>Assessment of public Transport infrastructure</li> <li>Review of IPT infrastructure</li> <li>Review of Mass transit infrastructure</li> </ul> | <p>Stage 2.3: Study of existing travel pattern and behaviour through surveys and data collected for revised master plan 2015</p> <ul style="list-style-type: none"> <li>Road network inventory</li> <li>Classified turning volume counts.</li> <li>Speed and delay</li> <li>Pedestrian count surveys</li> <li>Parking surveys</li> <li>Bus boarding alignment survey</li> <li>IPT survey</li> <li>Cordon survey</li> <li>Rail passenger survey</li> </ul> |

| <b>STAGE 3: Defining Benchmarks</b>  |  |
|--|--|
| Defining Benchmarks for various scenarios in order to come up with best scenario   |  |
| <b>STAGE 4: Scenario Development</b>   |  |
| Stage 4.1: Development of Business as Usual scenario   | Stage 4.2: Development of Sustainable Urban Transport Scenario |
| <b>STAGE 5: Four Stage Modelling to test BAU and other Sustainable Urban Transport Scenario</b>  |  |
| <b>STAGE 6: Development Of Urban Mobility Plan</b>   |  |
| <p>Stage 6.1: Formulation of Plans</p> <ul style="list-style-type: none"> <li>Integrated land use and urban mobility plan</li> <li>Public transport improvement plan</li> <li>Road network development program</li> <li>NMT facility improvement plan</li> <li>Multimodal integration plan</li> <li>Intermodal public transport plan</li> <li>Traffic engineering and Management plan</li> <li>Travel demand measures for Bengaluru</li> </ul> |  |
| <b>STAGE 7: Formulation Implementation Program For CMP</b>   |  |
| Stage 7.1: Formulation of REGULATORY MEASURES  |  |
| Stage 7.2: Formulation of INSTITUTIONAL STRATEGY   |  |
| Stage 7.3: Formulation of FISCAL STRATEGY  |  |

## 2 Review of City Profile

### 2.1 Brief Profile of the Study Area

The Comprehensive Mobility Plan (CMP) is prepared for Bengaluru study area, which comprises Bangalore Metropolitan Area (LPA Area), part of BMICAPA Area and 2 Hoblis of BIAPPA Area (Jala Hobli and Kasba Hobli) which include the Airport and most of the proposed development of BIAAPA areas. The extent of the study area is 1594.99 Sq.km and houses a total population of 89.44 lakhs as per 2011 census and current population of 130 lakhs. Bangalore Metropolitan Area comprises the major part of the Bruhat Bangalore Mahanagara Palike (excluding area under BMICAPA) and 251 villages in the periphery of BBMP.

The city has experienced an unprecedented population growth translating into varied challenges of urbanisation and urban management in general and urban land management in particular.

#### *City Planning*

In order to give direction to the growth of city, development authorities have prepared master plans in earlier years.

**Table 2-1: Highlights of Master Plans of BMA**

| Sl. No. | Master Plan                 | ODP       | CDP 2000  | RCDP 2011 | RMP 2015  |
|---------|-----------------------------|-----------|-----------|-----------|-----------|
| 1       | Plan period                 | 1961-1976 | 1984-2000 | 2000-2011 | 2005-2015 |
| 2       | Projected Population (lakh) | 19        | 70        | 70        | 88.0      |
| 3       | LPA Extent (Sq.km)          | 500       | 1279      | 1279      | 1219.5*   |
| 4       | Conurbation (Sq.km)         | 264       | 440       | 564       | 804.0*    |
| 5       | Agriculture Zone            | 236       | 866       | 742       | 415.5     |
| 6       | Existing Land use (Sq.km)   | 142       | 202       | 284       | 420.0     |
| 7       | Existing Density (PPH)      | 116       | 144       | 143       | 138.0     |
| 8       | Proposed Density PPH        | 72        | 159       | 125       | 110.0     |

\*- Area under LPA of BDA as per RMP-2015 excluding the area under BMICAPA

Earlier this year, Revised Master Plan 2031 has been prepared for the Bangalore Metropolitan Area with an LPA extending 1294.0 Sq.km and submitted to the Govt. of Karnataka for approval and adaptation for implementation.

## Population

Population of Bangalore Metropolitan Area has been growing at the rate of about 3% per annum since independence as shown in **Table 2.2**. The BMA area, which had a population of about 17 Lakh in 1971, reached 85 lakhs in 2011. Bangalore was one of the fastest-growing Indian metropolises for the decade 1991–2011. It has an average density of about 148 people / hectare.

**Table 2-2: Growth of Population in Bangalore Metropolitan Area**

| Year  | Population (Lakh) | Decadal Growth (%) | Annual Growth (%) |
|-------|-------------------|--------------------|-------------------|
| 1971  | 16.64             | 37.88              | 3.26              |
| 1981  | 29.22             | 75.56              | 5.79              |
| 1991  | 41.37             | 41.60              | 3.54              |
| 2001  | 57.01             | 37.81              | 3.26              |
| 2011  | 85.20             | 49.44              | 4.10              |
| 2018* | 122.98            |                    |                   |

*Source: Census of India 2011, \*Estimated*

As per Census 2011 data, the literacy rate of BMA area is 89.56% which is higher than national urban average of 85% and second highest for an Indian metropolis after Mumbai. The city's workforce structure is predominantly non-agrarian with only 6% of workforce being engaged in agriculture-related activities. Roughly, 10% of Bangalore's population lives in slums - a relatively low proportion when compared to other cities in the developing world.

BIAAPA which has been considered in the planning for CMP has picked up pace in development in the recent years. As on 2018, the estimated population in BIAPPA area is about 5.8lakhs. The historical population in areas under BIAPPA is presented in **Table 2.3**.

**Table 2-3: Population of BIAAPA**

| S.N. | Years | Population (Lakh) | Decadal Growth (%) | Annual Growth (%) |
|------|-------|-------------------|--------------------|-------------------|
| 1    | 1991  | 3.28              | -                  | -                 |
| 2    | 2001  | 4.05              | 19.01              | 2.13              |
| 3    | 2011  | 5.00              | 19.00              | 2.13              |
| 4    | 2018* | 5.78              |                    | 2.09              |

*Source: Census of India, \*Estimated*

## Employment

The workforce participation rate for BMA, as per Census, in 2011, is 43.9% , which has increased from 33.4% in 1991, indicating 5% increase in over previous decade and can be primarily attributed to high growth in IT sector and in migration. As per Census 2011, the male workforce participation is at 61.87% , whereas female work participation is 24.42% . The female participation rate has increased from 11.88% in 1991 to 24.42% in 2011. **Table 2.4** present the workers by gender for past three decades in BMA Region.

**Table 2-4: Comparison of Work Force in BMA**

| S.N. | Year  | Workers   |           |           |             |           |                       |
|------|-------|-----------|-----------|-----------|-------------|-----------|-----------------------|
|      |       | Male      | % of Male | Female    | % of Female | Total     | % of Total Population |
| 1    | 1991  | 12,58,609 | 52.8      | 2,55,214  | 11.8        | 15,13,823 | 33.4                  |
| 2    | 2001  | 18,77,261 | 57.7      | 5,33,701  | 18.1        | 24,10,962 | 38.9                  |
| 3    | 2011  | 29,17,774 | 61.8      | 10,57,196 | 24.4        | 39,74,970 | 43.9                  |
| 4    | 2018* |           |           |           |             | 52,60,098 |                       |

*Source: RMP 2031, Bangalore \*Estimated*

## 2.2 Review of Existing Transport System

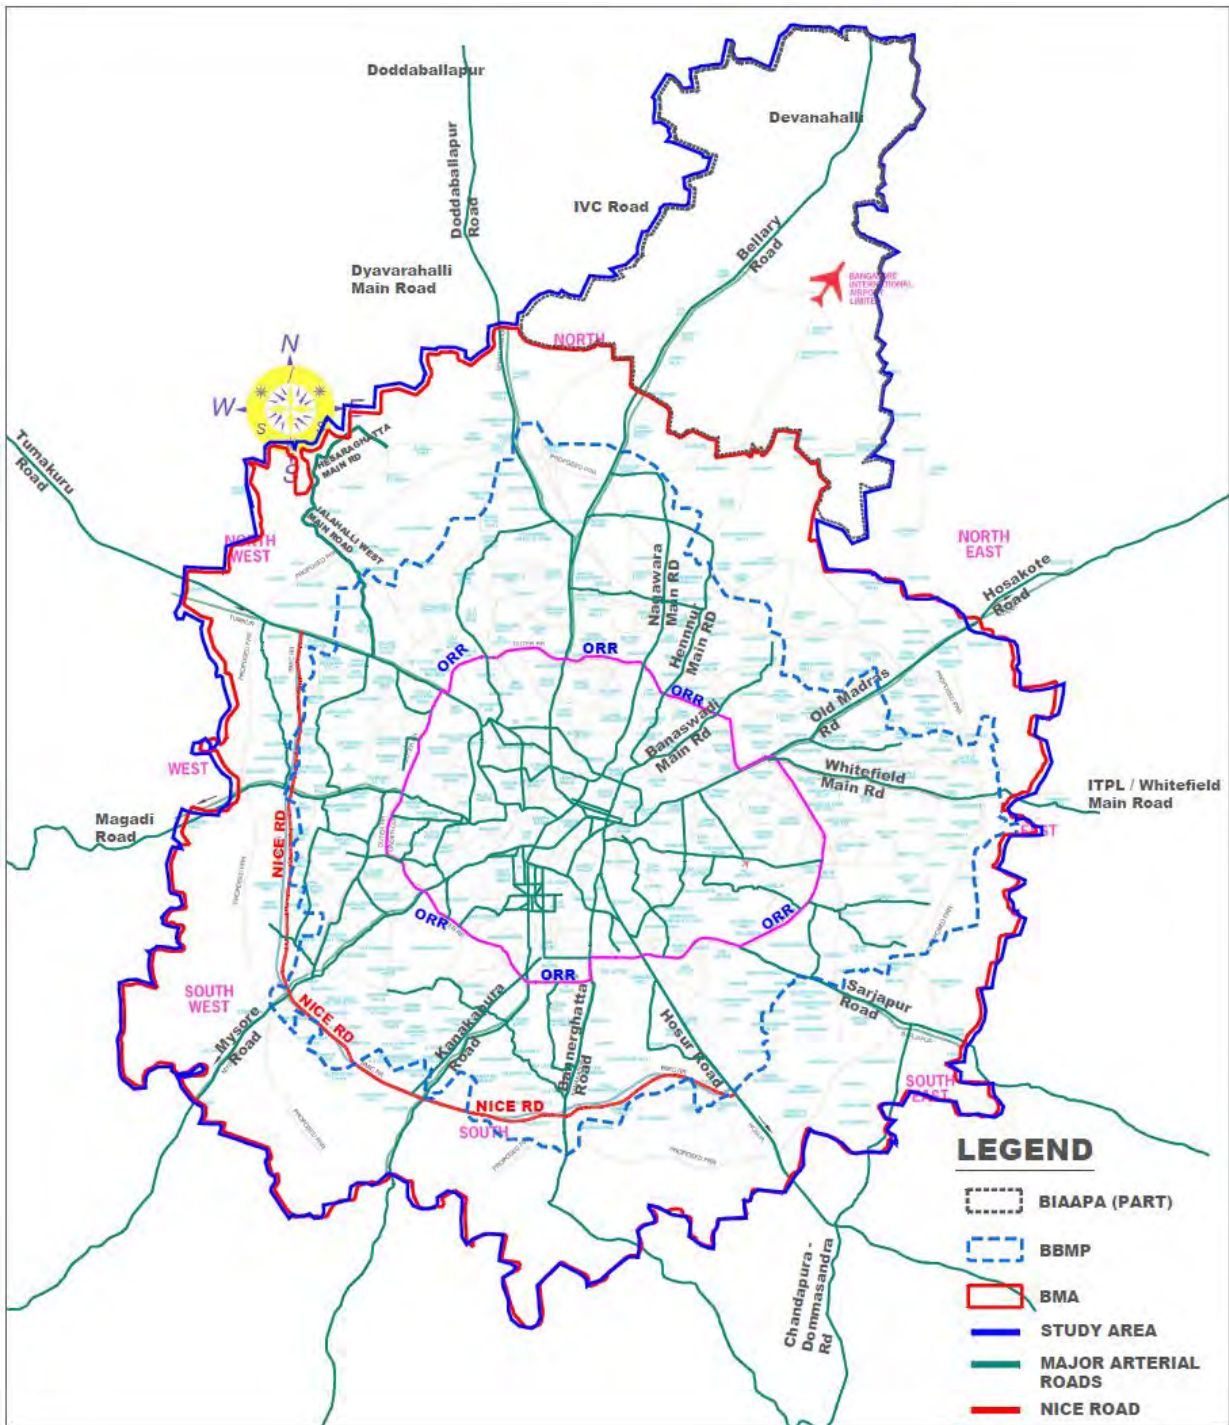

### 2.2.1 Road Network

Bangalore is endowed with a ring radial pattern of road network in the core area of the city. Bangalore's road network, spanning 14,000 km of the road network consists of ring roads, major roads (arterial roads, sub-arterial roads and other mobility corridors) and residential streets. However, there is no clear hierarchy of roads and this situation has resulted in low speeds, increased conflicts of traffic, etc. Though there is large network of roads in the city, the major road network comprised less than 20% of the total road network in the city.

Review of road network in the city revealed that there are quite a few missing links, which once developed would improve connectivity in the city. Some of them are:

- Missing links within the Intermediate Ring Road which include connecting CIL Main Road and Pottery Main Road, connecting Baiyappanahalli Main Road and Pottery Main Road and augmentation of Banashankari 50 feet road that connects to BMIC Expressway
- Inner Peripheral Ring Road, which is a newly identified ring in between ORR and PRR. The alignment is a combination of existing and new roads. It connects suburbs such as Yelahanka, Jakkur, RK Hegde Nagar, Horemavu, Kithaganur, Sonnenahalli, Kadugodi, Varthur, ChikkaBegur, Hulimavu, Kengeri, Ullal, Nagasandra and Chikbanavara. This is a critical link as it connects areas which will further densify in the coming years.
- Peripheral Ring Road (PRR) is critical to BMA, the master plan also proposes that the PRR be extended and developed complimenting existing NICE corridor.

The major roads in the study area are shown in **Figure 2-1**.

**Figure 2-1: Existing Road Network Map**

### Intersections

There are an estimated 40,000 intersections in the city of which about 398 are signal controlled and approximately 600 intersections are being manually controlled during peak hours. Grade separators have been constructed at 59 intersections, which includes 38 flyovers and 21 underpasses, to provide uninterrupted movement for the through traffic along major roads. The balance intersections are uncontrolled which is one of the reasons for congestion and unsafe crossings. While most of these controlled intersections are on major corridors of movement, it may be safe to consider, an equal number of intersections on these major roads are left un-controlled which are causing congestion and resulted into reduced safety.

Bangalore Traffic Police have undertaken improvements at some of the intersections under BTrac program which is aimed at providing geometric improvements, standardization of signs etc. Under B-TRAC program, police are undertaking following:

- ✓ Minor Junction Improvement
- ✓ Intelligent Transportation Systems
- ✓ Surveillance / Enforcement cameras
- ✓ Street Furniture
- ✓ Traffic Enforcement Cameras
- ✓ Education / Awareness & capacity building

Traffic Management Center has been setup by integrating various components of road marking, signages, Enforcement Cameras, Surveillance Cameras, and up gradation of Signals including Vehicle Actuation for effective and efficient management of traffic. As part of the ITS program, it is envisaged to install vehicle actuated, networked and adaptive traffic signals at about 440 intersections which will be monitored and controlled at Traffic Management Center, installation of traffic enforcement cameras at about 400 locations. Data collected at selected signalized junctions indicate that the signal operations are not optimal and are resulting in undue delays. Table 2-5 indicates percentage of green time wasted during the observation period at selected junction in central parts of the city.

**Table 2-5 Green Time Wasted at Signalized Junctions**

| S. No | Junction Name                          | Operating hours per day (in Min) | Green time wasted |            |
|-------|--|----------------------------------|-------------------|------------|
|       |  |                                  | Minutes           | Percentage |
| 1     | Queens junction (MG Road)              | 930                              | 281               | 30%        |
| 2     | Cauvery Art & Craft junction (MG road) | 960                              | 179               | 19%        |
| 3     | Trinity circle (MG road)               | 960                              | 329               | 34%        |
| 4     | Kamaraj junction                       | 870                              | 127               | 15%        |
| 5     | Opera road junction                    | 930                              | 144               | 15%        |
| 6     | Vellara junction (Hosur road)          | 240*                             | 81                | 34%        |
| 7     | Bhaskaran junction (Old Madras road)   | 900                              | 510               | 57%        |

*\*\* surveyed time and not full day operational time.*

Source: ITS Master Plan for Bengaluru, DULT

Hence, there is significant scope to improve efficiency of signalized junctions, by an average of 30% increased throughput by utilization of demand responsive signals at key junctions in the city.

### 2.2.2 Public Transport System

Primarily there are two public transport services operating in the city with BMTC offering the road based transport services and BMRCL, the rail based services. There are plans to induct commuter rail services (to be operated by Indian Railways) connecting suburban areas with major activity centers in the

city which may take some more time before commuter rail services are available for public.

#### ***Bus Transport System in Bangalore***

Bus system operated by BMTC has been the primary public transport system in Bangalore City. BMTC has established 45 depots for providing services in the city. BMTC is operating 6143 schedules (as on Aug 2018) every day. The Physical performance of BMTC is presented in **Table 2-6**.

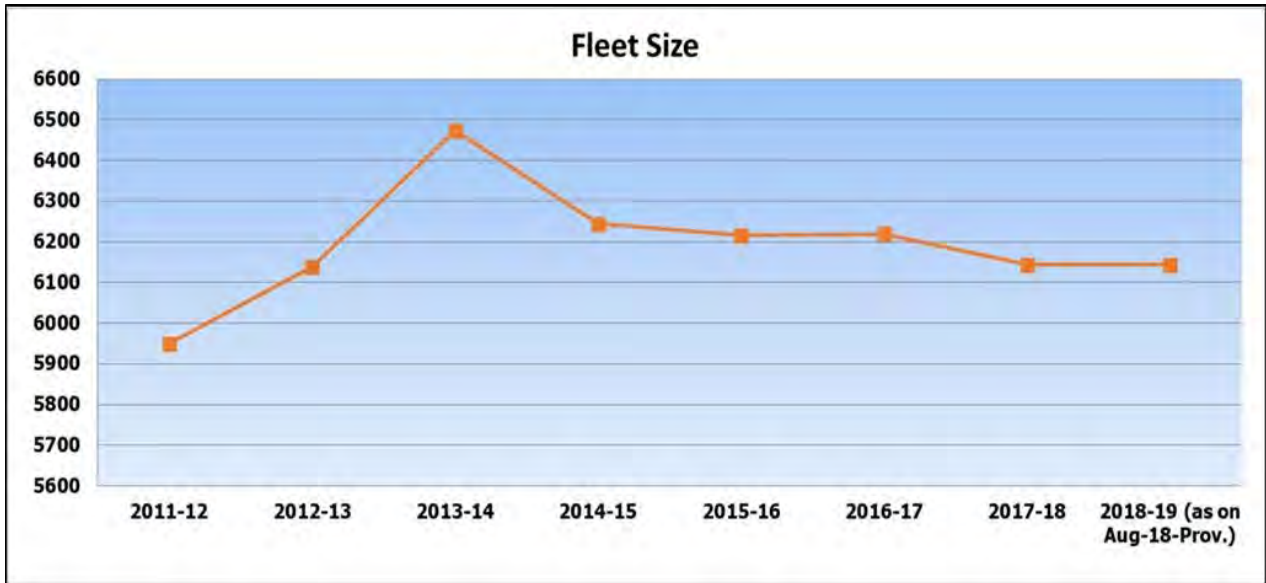

**Table 2-6: BMTC Performance**

| Parameter                         | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 (as on Aug-18- Prov.) |
|-----------------------------------|---------|---------|---------|---------|---------|---------|-------------------------------|
| Depots                            | 39      | 39      | 40      | 40      | 43      | 44      | 45                            |
| Fleet Operated                    | 6139    | 6473    | 6244    | 6216    | 6219    | 6143    | 6143                          |
| Vehicles Held                     | 6431    | 6775    | 6522    | 6401    | 6161    | 6677    | 6634                          |
| Effective Km. Per day (Lakh)      | 12.71   | 13.14   | 12.9    | 12.21   | 11.52   | 11.42   | 11.38                         |
| Total Service km (Lakh km)        | 4638.38 | 4795.90 | 4708.56 | 4469.82 | 4205.20 | 4164.53 | -                             |
| Veh. Utilisation (Km)             | 221.1   | 218.2   | 214.5   | 208.5   | 206.5   | 203.8   | 202                           |
| Passengers carried per day (Lakh) | 48.46   | 50.25   | 51.30   | 50.74   | 45.34   | 44.37   | -                             |
| Passenger load factor (%)         | 68.5    | 67.2    | 75.8    | 74.2    | 68.8    | 66.8    | -                             |

Source: BMTC, Bangalore

The trend of increase in BMTC Bus Fleet Size over the years is shown in **Figure 2-2**.

**Figure 2-2: Trend in Bus Fleet Size**

BMTC buses per lakh population are presented in **Table 2-7**. As per the Central Institute of Road Transport (CIRT) report Bus Transport Supply Index (buses per lakh of population) must be approximately 50. Though the fleet supply is adequate the efficiency of BMTC bus service is declining over the years.

**Table 2-7: BMTC Buses Per Lakh Population-Chart**

| Year | Population | BMTC Bus Fleet Size | Buses Per Lakh Population |
|------|------------|---------------------|---------------------------|
| 2001 | 61.9       | 2658                | 43                        |
| 2011 | 90.44      | 5949                | 66                        |
| 2018 | 122.98     | 6143                | 50                        |

As can be seen from **Figure 2.2** the fleet size was increasing rapidly from 2001 to 2011. However, off late the number of buses have not kept pace with the growing population and the buses per lakh population now stands at 50. Further the bus utilization has been reducing due to the ever rising private vehicular population in city, leading to congestion affecting the overall turnaround time. This has impacted the revenue generation.

***Metro Network***

Two corridors of Metro Rail are in operation in Bangalore. One is the East-West corridor and the other is the North-South corridor. The East-West Corridor starts at Baiyappanahalli (Reach 1) and ends at Mysore Road (Reach 2). The North-South Corridor starts at Nagasandra (Reach 3) and ends at Puttenahalli (Reach 4). The total length of the Metro Rail network under operation is 42.30 Km. Extensions on East-West Corridor, North-South Corridor & two new lines

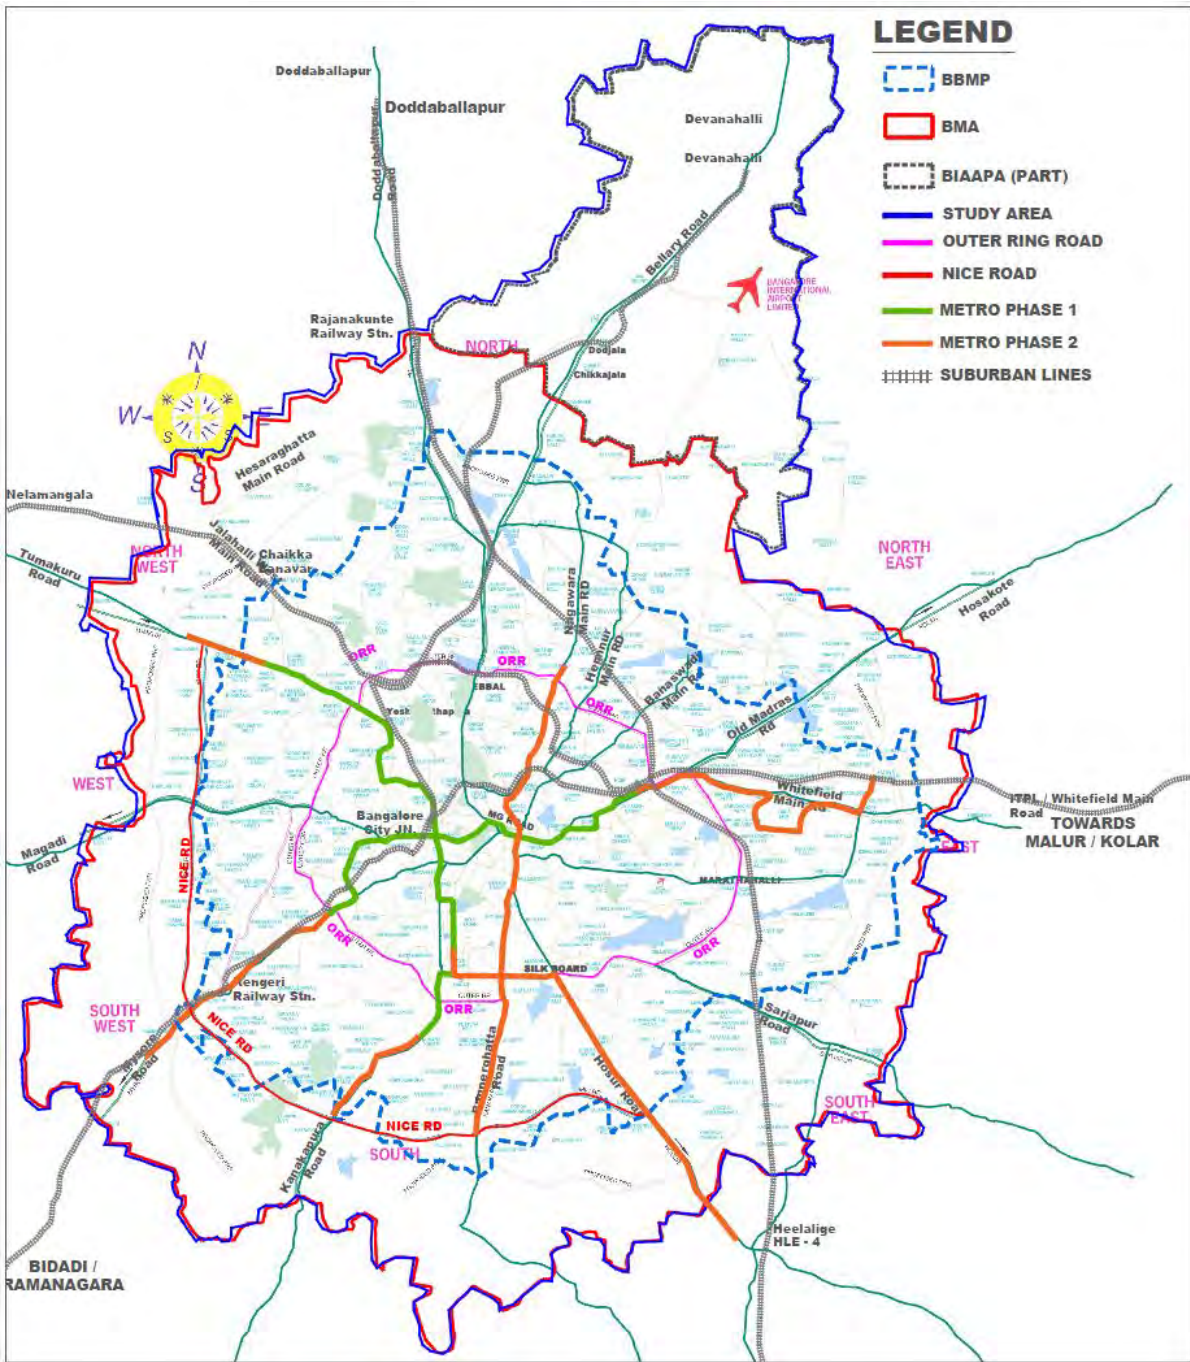

Reach 5 & Reach 6 under Phase 2 (72.1km) are under implementation. **Table 2-7** presents reach wise lengths for Phase 1 and Phase 2.

**Table 2-8: Metro Corridors along with the Stretches and their Status**

| Sl. No. | Corridor   | Length (km) | Status                   |
|---------|--|-------------|--------------------------|
| Phase 1 |  |             |                          |
| 1       | Baiyappanahalli to Mysore Road (East – West Corridor- Purple Line) (R1 & R2) | 18.1        | Operational              |
| 2       | Nagasandra to Yelachenahalli (North- South Corridor- Green Line) (R3 & R4)   | 24.2        | Operational              |
| Phase 2 |  |             |                          |
| 1       | N-S Line Extension from Puttenahalli Cross to Anjanapura Township (R 4B)     | 6.29        | Construction in progress |
| 2       | N-S Line Extension from Hesarghatta Cross to BIEC (R3C)                      | 3.77        | Construction in progress |
| 3       | E-W Line Extension from Baiyappanahalli to ITPL- Whitefield (R 1A, R 1B)     | 15.5        | Construction in progress |
| 4       | E-W Line Extension from Mysore Road Terminal to Kengeri (R2A , R2B)          | 6.465       | Construction in progress |
| 5       | New N-S Line IIMB to Nagawara (R6)   | 21.25       | Construction in progress |
| 6       | New E-W Line to R.V.Road to Bommasandra (R5)                                 | 18.82       | Construction in progress |

Average daily ridership in the two corridors under Phase 1 has increased to 4.05 lakhs in the year 2019. The metro was predominantly operating with 3 car trains which were running completely packed during the peak hours. BMRCL is now introducing 6 car trains in a phased manner and this move is expected to improve the capacity, and attract increased ridership.

**Figure 2-3: Bangalore Metro Network**

Metro expansion under Phase 2 covering 72 km is under construction.

***Sub-Urban Railway Network***

Bangalore city has a fairly good rail network of about 62 km within the city. There are a few diesel operated passenger trains that connect to Bangalore City with Tumkur, Mysore and Kuppam (Andhra Pradesh). The trains run in the morning and return in the evening catering to commuters from suburban areas, satellite towns and neighboring cities. They are well

patronized and in the recent past the patronage has shown good growth rate. But their frequency and availability are not adequate to make this as primary / preferred mode of transportation.

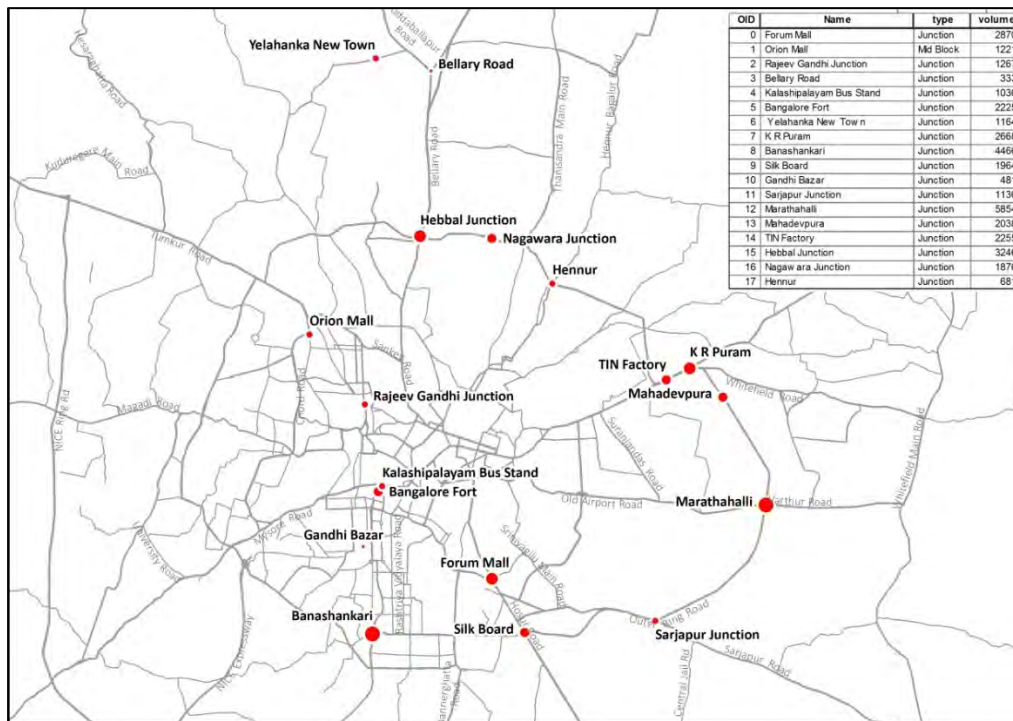

The utilization of existing railway network in the city for running robust sub-urban rail services connecting the peripheral areas and settlements around Bangalore is being explored and a detailed study has been made by Indian Railways to introduce a commuter rail services including identifying the improvement requirement to the railway network.

### 2.2.3 Non-Motorized Transport

The major components of non-motorized infrastructure include pedestrian and bi-cycle infrastructure.

- Pedestrian Infrastructure
- Bicycle Network
- Public Bike Sharing

Footpath of narrow width is available on most of the road network; however, the use is limited on large parts due to encroachment, unscientific ramps/access to properties, disconnected network, uneven surface etc. The road widening projects taken up in the city have resulted in the reduction of footpath widths inconveniencing pedestrians. Despite all constraints, pedestrian movement is significant on all major roads and intersections in the city. Figure 2-4 shows pedestrian volumes during peak hours at few important junctions in the city.

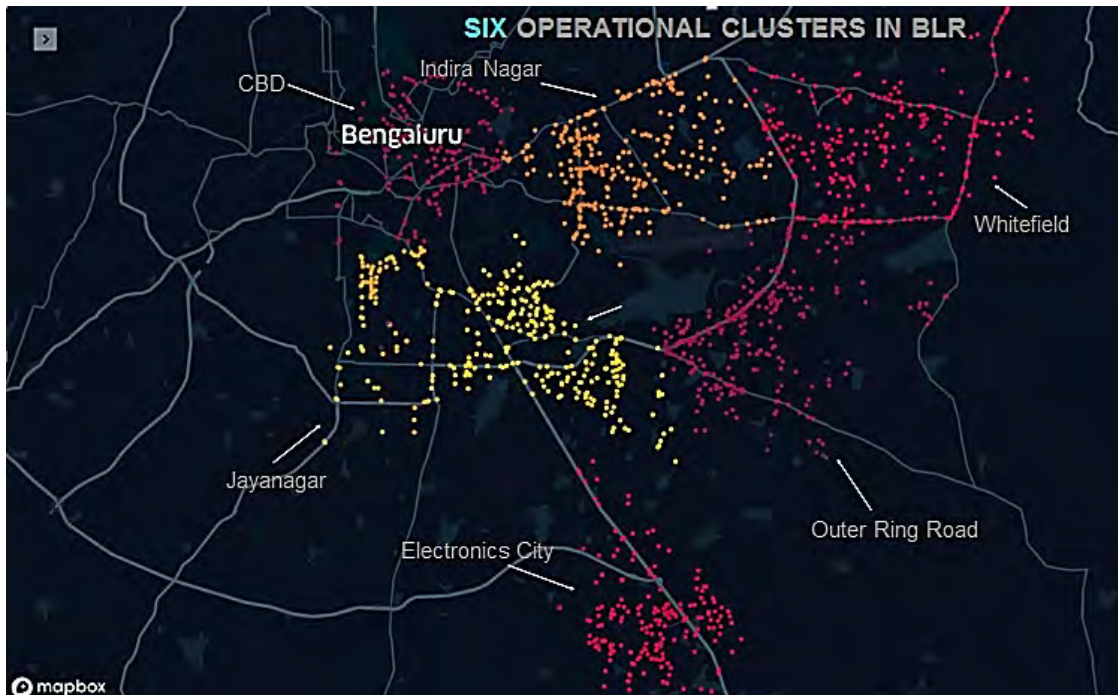

**Figure 2-4: Pedestrian Crossing Data at Selected Junctions**

In order to improve the situation, BBMP has taken up Tender Sure works in the Central Business District incorporating wider footpaths and proper accommodation for utilities. Under this

program, the city corporation is developing NMT network for the convenient and safe mobility of pedestrians and cyclists.

Public bike sharing (PBS) is operational in parts of the city and DULT is in the process of extending the public bike sharing system to the entire city. The PBS system is focused around the metro stations and the residential areas/ activity centers to help in providing last mile connectivity. As part of the program, docking/parking stations are developed and bicycles equipped with GPS are included for use by general public which can be booked through a mobile application.

In Phase 1, implementation of Cycle Parking Hubs and Cycle Tracks is proposed on MG Road, near Vidhanasoudha and in areas like Koramangala, HSR Layout, Indiranagar, Banaswadi, HRBR Layout, HBR Layout, Kacharkanahalli, etc. In all about 270 cycle parking hubs are being taken up, each located at a spacing of 300-500m for easy accessibility for the public. PBS is also operational around IT clusters like Whitefield area, Electronic city and Outer Ring Road corridor.

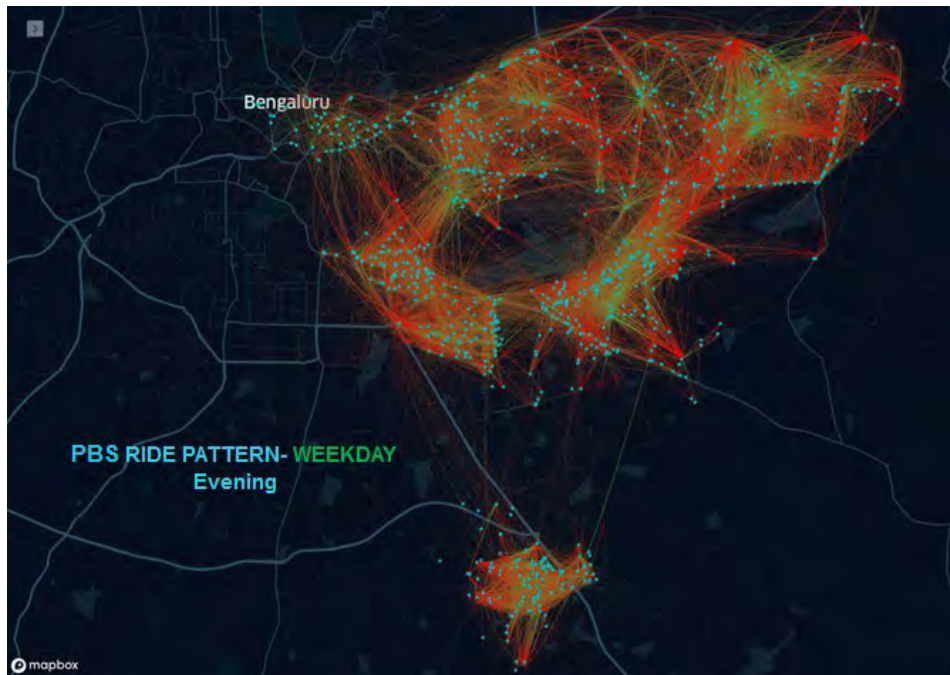

Source: Yulu

**Figure 2-5: PBS Operation Clusters in Bengaluru.**

Introduction of PBS system in the city has fueled usage of bicycles, despite non-existent network infrastructure for bicycling in the city. Currently more than 4,700 bicycles are operated with an average of 10,000 rides per day catered by PBS system. The average distance of trips on PBS is about 2km. An estimated 60% of trips on PBS happen for work place connectivity, 15% of the trips happen as first or last mile to metro & suburban rail and rest of the trips are leisure trips typically within residential areas. Figure 2-6 shows snapshot of ride pattern during typical weekday evening peak travel period in PBS operation areas.

Source: Yulu

**Figure 2-6: PBS Ride Pattern on a Typical Weekday.**

#CycleToWork is another platform started in October 2018 that collects data from registered users who commute to their work place by bi-cycle. More than 990 users track their bicycle ride on a regular basis on this platform. Data published from this platform (shown in Figure 2-7) shows that the cumulative trip lengths made on bicycle has been steadily increasing over time, which is an indication of gaining popularity of bicycling in the city for commute purposes.

Source: Bicycle Mayor Bengaluru

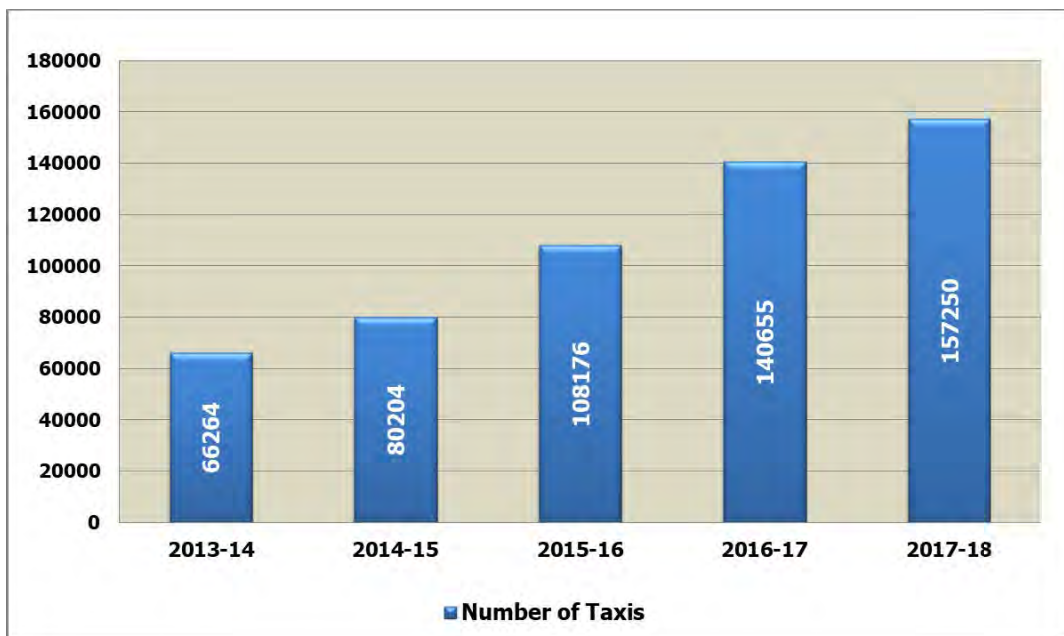

**Figure 2-7: Cumulative Bicycling Length Data from # CycletoWork**

Hence, there is a clear indication that with better infrastructure for non-motorized vehicles like dedicated path, parking provision, etc., more trips in the city could be catered by non-polluting modes like walking and cycling.

### 2.2.4 Intermediate Public Transport

Auto rickshaws and taxis are offering the Intermediate Public Transport facility in the city. Off-late, taxi aggregators namely Ola, Uber etc. have expanded their services and fleet considerably. Being convenient and easily available and accessible, utilization of IPT has grown considerably in the last 3-5 years.

The city has an estimated 1.57 lakh taxis as of March 2018.

Source: Transport Department, Government of Karnataka

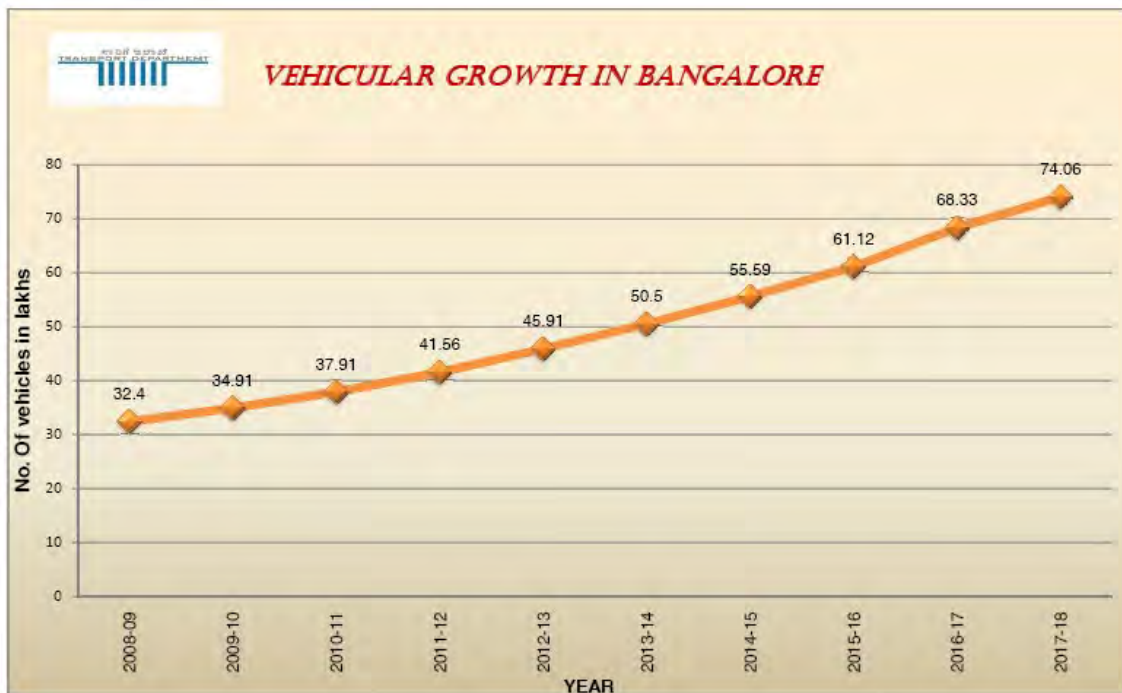

**Figure 2-8: Growth of Taxis in Bengaluru**

Auto-rickshaws with their new found competitors (taxi aggregators) are generally providing the last mile connectivity near metro stations. However, there has not been any reduction in the number of vehicles in the city. Auto-rickshaws cater to a substantial 13% of total trips but constitute only 3% of total vehicular numbers.

With the availability of limited organized auto-rickshaw stands in the city areas, these are parked along the roads and near bus stops for picking up passengers there by occupying precious road space. This situation is resulting in avoidable congestion. The need for stands/ dedicated parking/waiting spaces across the city is very much there as they are an important component in the transportation system in the city.

### 2.2.5 Vehicle Growth in the City

The Bangalore Metropolitan Region has a total registered vehicular count of approximately 74 lakh vehicles, with two wheelers constituting the highest percentage of vehicular composition. Between 2008 and 2018, the number of vehicles registered in Bangalore has increased from 32.4 lakhs to 74.06 lakhs (**Figure 2-9**). **The vehicle ownership has increased from 284 vehicles per thousand persons in 2001 to 419 vehicles per thousand persons in 2011 and further to an estimated 640 in 2018.** This mean the vehicle population is increasing at much higher rate compared to rate of growth in population.

Source: Annual Report 2017-2018, Transport Dept. GoK

**Figure 2-9: Vehicular Growth in Bengaluru**

#### *Composition of Vehicle Categories in the City*

Two-wheelers dominate the vehicular composition with a share of 69% in the total registered vehicles, followed by cars and jeeps at 19% .

Source: Transport Department, Government of Karnataka

**Figure 2-10: Composition of Registered Private Vehicles in Bengalore**

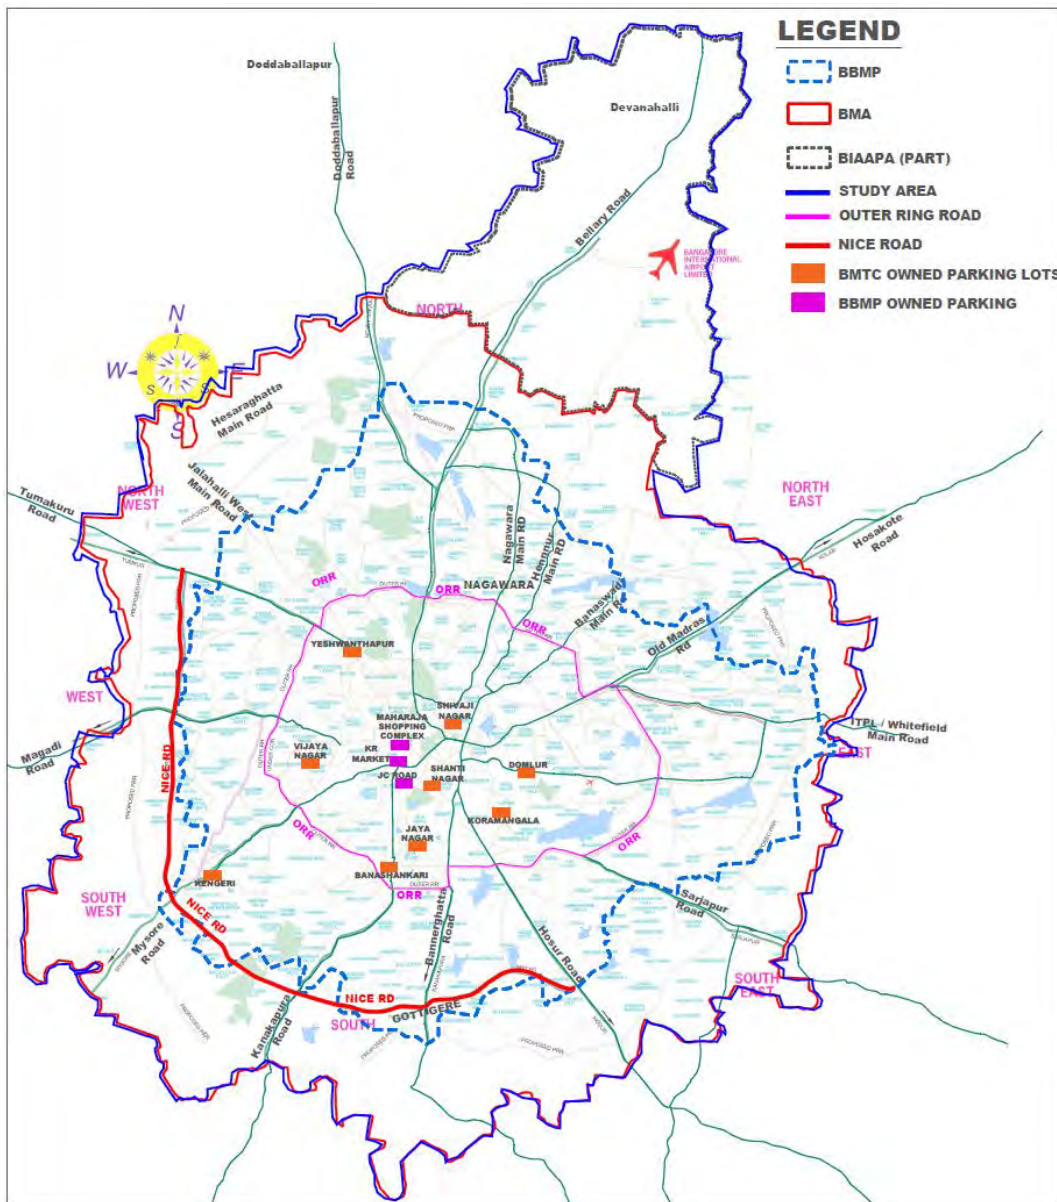

### 2.2.6 Goods Transport

For the movement of containers, BMR is catered by Container Corporation of India (CONCOR) through its Inland Container Depot (ICD) at Whitefield; Bangalore with a Container Freight Station (CFS) and 10 warehousing facilities. Container Warehousing Corporation (CWC) also caters BMR through its Rail Side Warehousing (RSW) at Whitefield since 2002.

### 2.2.7 Parking

Bangalore with its predominantly mixed land use, is inflicted with on-street parking. There are very few public off-street parking facilities in the city. There are about 11 public off-street parking places; of these nine were developed by BMTC and two by BBMP.

**Figure 2-11: BMTC and BBMP Parking Spaces in Bengaluru**

Apart from these, there is one parking place developed on PPP basis adjacent to Garuda mall. Two parking complexes - one in Maharaja complex on KG road and another by BDA in Jayanagar have off-street parking spaces available for public.

In all the total capacity of off-street parking spaces available in the city for general public is about 1300 cars and 4000 two wheelers. However, the numbers do not include parking spaces provided in shopping malls.

A parking policy has been developed for Bengaluru which restricts total demand as one of the means to increase Public Transport Ridership.

As part of the station planning, at few metro station locations, parking is made available which is essentially serving the metro users.

With on-street parking available in almost all roads and for free, the utilization of off-street parking spaces is limited except a few.

### 2.2.8 Road Accidents

Injuries and death associated with road crashes cause considerable economic loss to affected individuals, families and the nation as a whole. Road accident data pertaining to the Bangalore city for the period from 2007 to 2018 has been presented in **Table 2-9**.

**Table 2-9: Road Accident Scenario of Bangalore City**

| Year | Fatal | Non-Fatal | Total |
|------|-------|-----------|-------|
| 2007 | 957   | 7,469     | 8,426 |
| 2008 | 864   | 6,908     | 7,772 |
| 2009 | 737   | 6,138     | 6,875 |
| 2010 | 816   | 5,667     | 6,483 |
| 2011 | 727   | 5,297     | 6,024 |
| 2012 | 740   | 4,767     | 5,507 |
| 2013 | 737   | 4,493     | 5,230 |
| 2014 | 711   | 4,293     | 5,004 |
| 2015 | 714   | 4,114     | 4,828 |
| 2016 | 754   | 6,752     | 7,506 |
| 2017 | 609   | 4,455     | 5,064 |
| 2018 | 661   | 3,950     | 4,611 |
| 2019 | 744   | 3,944     | 4,688 |

*Source: Bangalore Traffic Police*

Significant number of fatalities from road accidents involves vulnerable road users like pedestrians and two-wheelers. Of the total road traffic fatalities in 2018, motorcyclists and pedestrians comprise of 46% and 40% respectively. Although Table 2-9 indicates declining trend in the number of accidents and fatalities, the absolute number of fatalities still is quite high and all possible measures need to be taken to arrest high number of fatalities happening from road accidents. Measures should include better and safer facilities for vulnerable road users; better enforcement of violations such as over speeding vehicles, drunken driving, and road rage; road user education, etc.

**Figure 2-12: Trend of Road Accidents in Bengalore**

As can be seen from the **Figure 2-12**, the number of accidents has shown decreasing trend. While reduction in accidents is a welcome trend, the reason for the reduction is primarily attributed to interventions by Bangalore Traffic Police in enforcement and declining speeds due to congestion on the city roads (lower speeds lead to reduction in accidents is a well proven theory). The frequent presence of road humps, table tops, intersections, congestion lead to reduction in speeds in the city which is contributed significantly to safer roads in Bengalore.

Further, traffic police department is also undertaking a road safety program to identify accident prone areas, carryout detailed cause analysis and prepare improvement proposals to address the problem. As per the information available, Banaswadi, Madivala, Electronic City, Mico Layout, Whitefield, Peenya, RT Nagar, Hebbal, Yelahanka, Chikkajala and Devanahalli continue to be the most accident-prone areas in Bengalore.

### 2.3 Review of Energy and Environment

Transport sector has been identified as one of the main contributors to air pollution in cities. Contribution of automobiles in total air pollution in Indian cities is reported between 40–80 % [Solanki HK, 2016]. Nearly 20% of passenger transport emission is by private automobiles although they only contribute 4% total passenger transport activity in Indian cities.

As per paper on “Air quality, emissions and source contributions analysis for Greater Bengaluru region of India” (By Sarath K Guttikunda et. al., 2019) vehicle exhaust and on-road dust resuspension account for 56 % and 70 % of total PM2.5 and PM10 emissions respectively.

**Figure 2-13: Source of PM10 and PM2.5 emissions in Bengaluru**

The total Vehicle Kilometers Travelled (VKT) by the vehicles in the BMR region is about 31 million for the base year and is estimated to increase to about 48 million and 72 million for the years 2030 and 2050 respectively which is about 60% growth rate of VKT in 2050 from base year. The emissions estimated for the base year and future years are shown in **Table 2-10**.

**Table 2-10: Total Emissions**

| Pollutant       | Emissions in Ton/Year (% change w.r.t Base Year) |                  |                  |
|-----------------|--|------------------|------------------|
|                 | Base Year (2008)                                 | 2030             | 2050             |
| CO              | 15743  | 18179 (15%)      | 23567 (50%)      |
| HC              | 7315   | 2930 (-60%)      | 3841 (-47%)      |
| NOx             | 6985   | 28864 (313%)     | 22962 (229%)     |
| CO <sub>2</sub> | 695617   | 16782759 (2313%) | 17662478 (2439%) |
| PM              | 973  | 2009 (106%)      | 1519 (56%)       |

*Source: Verma A, Harsa V., Hemanthini AR. (2018), "Sustainable Transport Measures for Livable Bengaluru", Project Sub Report, IISc, Bangalore, India*

Since Bengaluru has the highest number of two-wheelers and second highest number of four wheelers in India, the fuel consumption is also very high. Bengaluru stands second in fuel consumption in the country only behind Delhi. According to Indian Oil, on an average, the petrol consumption in Bengaluru is about 70,000 KL a month.

However, it is long way before the city moves to alternate fuels in a large way. High utilisation vehicles as taxis, public transport modes are the most preferred to move to cleaner fuels. Steps in that direction are needed.

## 2.4 Review of Existing Land Use Pattern

The Existing Land Use (ELU) is the next critical input in devising the future growth strategy of any city/town. The ELU maps show various current land uses at the specified and reasonable scale indicating residential, commercial, industrial, public & semi- public uses, recreational (parks & playgrounds), open spaces, vacant land, land under agriculture, water bodies, utilities & services facilities, circulation system, conservation areas, special areas, committed land uses, reservations and mixed land uses etc.

The Master Plan document (RMP-2031) has been reviewed for the existing land use in the BDA Planning area with reference to the proposed land use and as per RMP-2015. This analysis helps in understanding the development pattern in the city.

While the shape and structure of the transport network is dependent on land use, land use itself cannot happen as planned if the transport network is not provided. In other words, land use and the network strategy must go hand in hand.

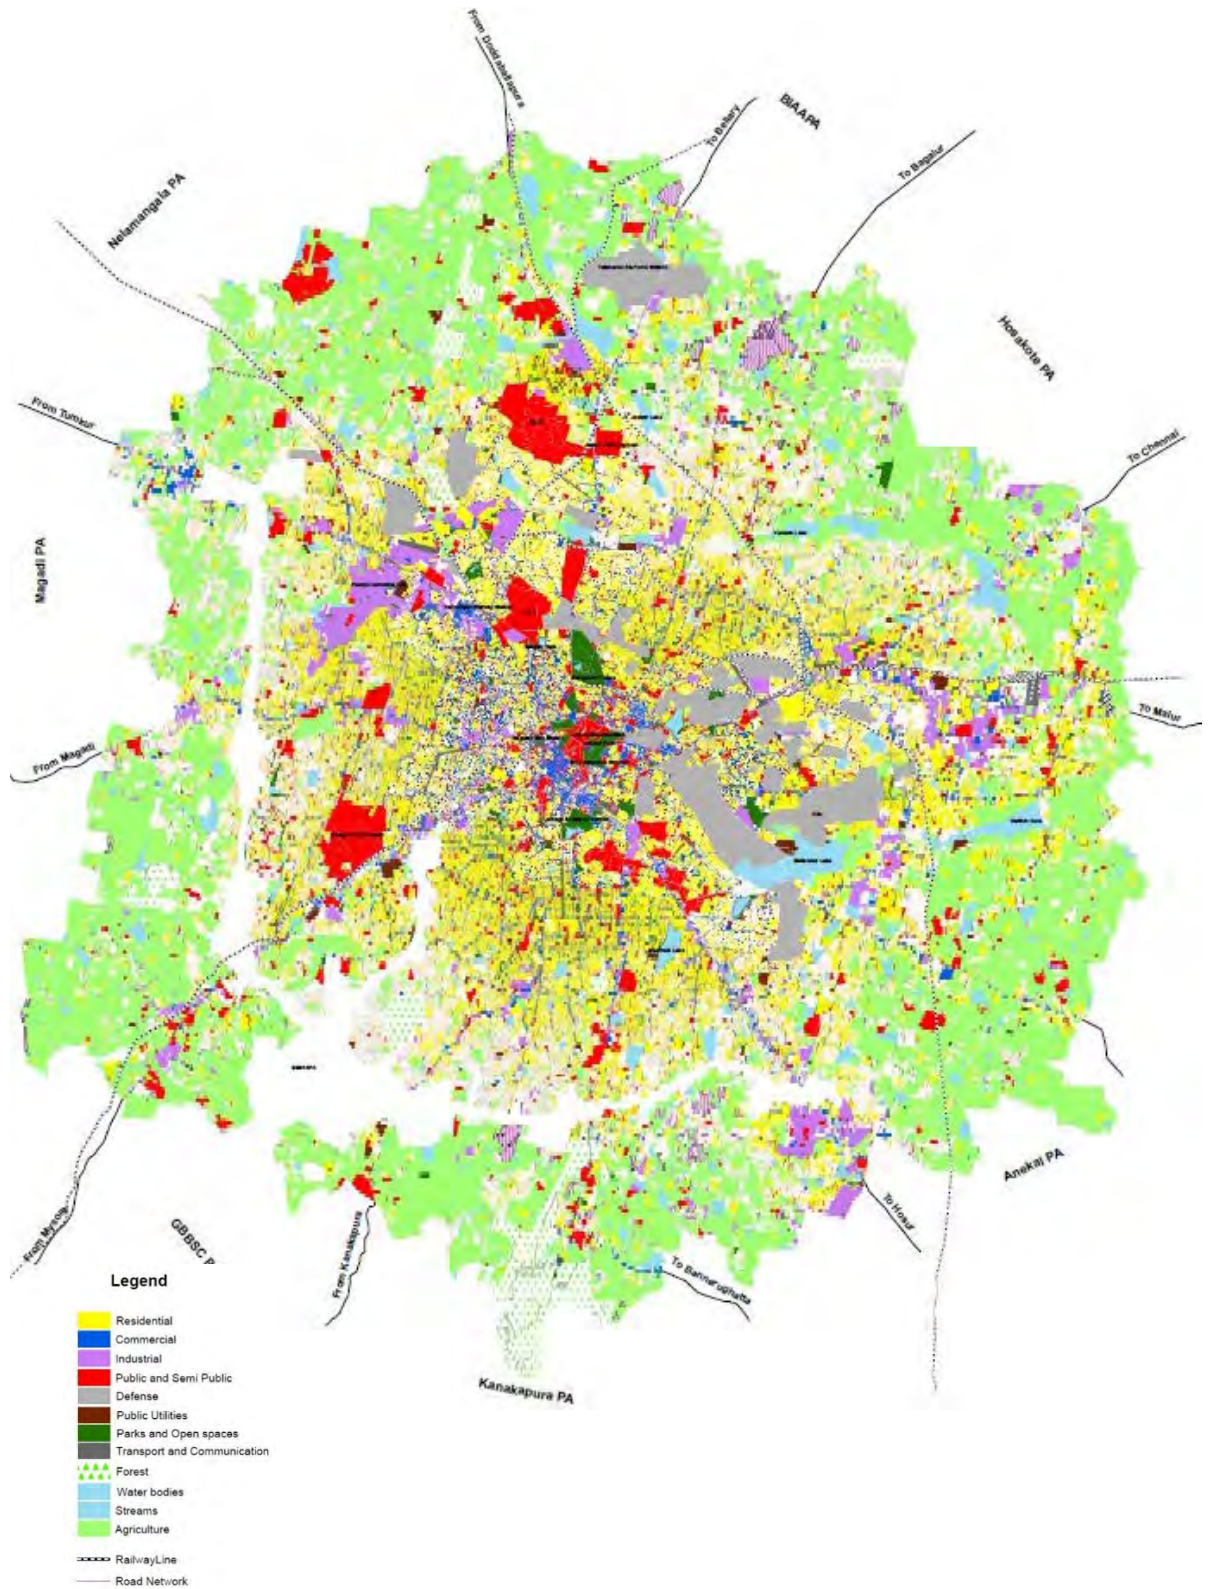

The Existing Landuse Map (ELU) is presented in **Figure 2-14**, whereas the ELU Area Statement for LPA of BDA is given in **Table 2-11**.

**Table 2-11: ELU Area Statement**

| Land Use                 | Existing Land use - 2015 |               |
|--------------------------|--------------------------|---------------|
|                          | Area (Sq.km)             | Share (%)     |
| Residential              | 212.83                   | 17.63%        |
| Commercial               | 38.27                    | 3.17%         |
| Industrial               | 45.63                    | 3.78%         |
| Public & Semi-public     | 64.82                    | 5.37%         |
| Un-classified            | 42.32                    | 3.51%         |
| Public Utilities         | 4.86                     | 0.4%          |
| Parks & Open Spaces      | 20.67                    | 1.71%         |
| Transport Communication  | 87.85                    | 7.28%         |
| Vacant                   | 305.28                   | 25.29%        |
| Agriculture land         | 300.42                   | 24.89%        |
| Quarry/Mining Sites      | 7.39                     | 0.61%         |
| Forest                   | 27.53                    | 2.28%         |
| Water Bodies and Streams | 49.1                     | 4.07%         |
| <b>Total LPA of BDA</b>  | <b>1206.97</b>           | <b>100.0%</b> |

*Source: Revised Master Plan for Bangalore - 2031 (Draft): Volume-3*

**Figure 2-14: Existing Land Use Map of BMA**

The Area allocated for transportation and communications falls very short of the requirements. The general norm is 20% but most cities achieve at least 15% and what Bangalore is bestowed with is only 7.3%. Densification shall be done as per the TOD policy. The peripheral areas will be able to imbibe development beyond 2041. The green areas especially in the North East (Arkavathi) and the South East and the South (Bannerghatta) are environmentally sensitive zones and will not be available for development. The thrust in growth hence will be essentially to the north and north-west. BIAPPA and the Airport zone at Devanahalli would be prime destinations for future growth.

## 2.5 Traffic Surveys

The compilation of data for modelling and demand forecasting is a massive task. This includes both primary data and secondary data. The purpose of conducting traffic surveys is to assess the traffic and transport characteristic of the study area (base line scenario) and provide inputs to developing the transport model. Focus of the surveys is on obtaining traffic volume data at select locations and major corridors.

The data collected from earlier studies like Revised Master Plan -2031, RITES Revised Final Report of Phase-III Corridors of Bangalore Metro 2016, Comprehensive Traffic and Transportation Study for Bangalore Metropolitan Region (BMR)-2018 and Parking Action Plan for Bangalore have been used for the current study.

The survey particulars (type of survey, time period, duration and number of locations) are presented in **Table 2-12**.

**Table 2-12: Survey Particulars**

| Sl. No. | Surveys   | Duration | Locations                |
|---------|---|----------|--------------------------|
| 1       | Screen Line Volume Count  | 16 hours | 45                       |
| 2       | Turning Volume Counts at Junctions (Source: Revised Master Plan 2031 for Bangalore (Draft)) | 24 hours | 14                       |
| 3       | Turning Volume Counts at Junctions (Source: CTTS for Bangalore Metropolitan Region )        | 12 hours | 75                       |
| 4       | Outer Cordon Counts   | 24 hours | 13                       |
| 5       | Roadside Interview Survey   | 24 hours | 13                       |
| 6       | On-street Parking Survey  |          | 7 Areas (Core Bangalore) |
| 7       | Speed and Delay Survey  |          | Primary Arterial Roads   |
| 8       | Household Interview Survey  |          | 10167 households         |
| 9       | Road Inventory Survey   |          | Primary Arterial Roads   |
| 10      | Goods Focal Point Survey  |          | 8                        |

## 2.5.1 Classified Volume Count

### *Screen line Volume Count Survey*

Three Screen lines have been identified for the study NSW, NSE, EW, thus making a total of 45 locations and 16-hour video graphical survey had been used to capture the traffic numbers. Primary traffic volume counts surveys on screen lines had been conducted to collect the traffic data for the urban transport demand model validation. The vehicles counted were converted to Passenger Car Units (PCU) by adopting equivalent PCUs. The PCUs corresponding to urban roads as per IRC: 106-1990 are used and the Peak Hour Traffic Volumes at screen Line location are presented in **Table 2-13**.

It is interesting to note that traffic flows are equally high on orbital roads such as the Chord Road and the outer ring road compared to some of the radial corridors. The very uniform spatial development of the city in nearly a circular growth pattern has led to this. In normal conditions this would have been an ideal situation for distribution of traffic, however the size of the city unfortunately has spared none and has congested all corridors (Radials and orbitals).

**Table 2-13: Peak hour Traffic volume at Screen line Locations**

| Sl. No. | ID    | Location Name                                     | Direction                 | Total | Total (PCU) | Both Direction (Vehicles) | Both Direction (PCU) |

**Turning Volume Counts at Junctions**

Classified Turning Volume Counts were carried out at 14 intersections. The peak hour PCUs observed indicate that the some of the critical junctions include Silk board junction, Hebbal junction and Hennur junction on the ring road. The peak hour traffic volumes and 24 hours traffic are given in **Table 2-14**.

**Table 2-14: Total Volume for 24 hours and peak hour on surveyed location**

| Sl. No. | Junction Name                 | Peak Hour Volume Vehicles | PCUs  | 24 -Hour Volume Vehicles | PCUs   | Type of Junction     |
|---------|-------------------------------|---------------------------|-------|--------------------------|--------|----------------------|

*Source: Revised Master Plan 2031 for Bangalore (Draft)*

From Table 2-14, it can be observed that, nearly all the junctions are operating beyond capacity resulting in considerable delays. Absence of left slip roads is adding to the inefficiency in leading to longer queue lengths at the intersections.

Data of the Turning Volume Count from CTTS 2015 at 75 intersections where the peak hour traffic was exceeding 10000 PCUs is presented in **Table 2-15**.

**Table 2-15: Turning Volume Count Locations exceeding 10000 PCUs**

| Location No | Location   | Peak hour     | Peak Hour Volume |         |
|-------------|--|---------------|------------------|---------|

### 2.5.2 Outer Cordon Road Side Interview

Classified traffic volume counts along with road side interviews had been carried out to assess the quantum of travel across the cordon. Origin-Destination/Road side interview survey was conducted at 13 locations to capture travel patterns. **Table 2-16** presents the Passenger Traffic at outer cordon locations.

**Table 2-16: Passenger Traffic at Outer Cordon Locations**

| Sl. No. | Location                        | Peak Hour Volume |      | 24 - Hour Volume |       |

Source: Revised master Plan for Bangalore-2031

As can be seen from Table 2-16, major traffic enters the city through NH7 (Hosur Road). The share of cars varies between 16% and 75% for the different locations and two wheelers vary from 8% to 59%. The percentage of trucks/ multi axle vehicles varies from 6% to 29% at various locations. Tumkur Road (NH4) has the highest percentage of goods vehicles at 29%.

The percentage share of Passenger and Goods traffic at the surveyed locations are 83 % and 17 % respectively and location wise Passenger/ Goods Traffic share for 24hour volume and peak hour volume is presented in **Table 2-17**.

**Table 2-17: Share of Passenger and Goods traffic at outer cordon Locations**

**Table 2-20: Summary of Goods Traffic Movement**

| Description                               | Total Number of Goods vehicles per day | Percentage (%) |
|---|--|----------------|
| External To Internal(Inbound)             | 28898                                  | 44%            |
| Internal to External(Out Bound)           | 23197                                  | 36%            |
| External To External(By passable Traffic) | 12886                                  | 20%            |
| <b>Total</b>                              | <b>64981</b>                           |                |

Source: Revised Master Plan for Bangalore-2031

The total goods movement observed from the outer cordon survey was 64981 out of which 44% was the inbound traffic (External to Internal movement) and 36% was out bound goods movement (Internal to External) and rest of 20% is the by passable traffic. The numbers presented in Table 2-20 shows that almost 12000 goods movement is just through traffic, which gives the clear indication that the city requires more logistic hubs outside the city limits.

**Type of Goods**

The majority of the goods that the commercial vehicles carried in the study area include Industrial material, manufactured goods, perishables (food grains, diary product and vegetables) and Tankers as shown in **Figure 2.15**.

Source: Revised Master Plan for Bangalore-2031,2015

**Figure 2-15: Types of Goods at outer cordon points**

**Trip Frequency-Passenger Vehicles**

Daily trips formed majority of the trips at the outer cordons, followed by alternate day and weekly trips. The trip frequency for all locations is presented in **Figure 2-16**.

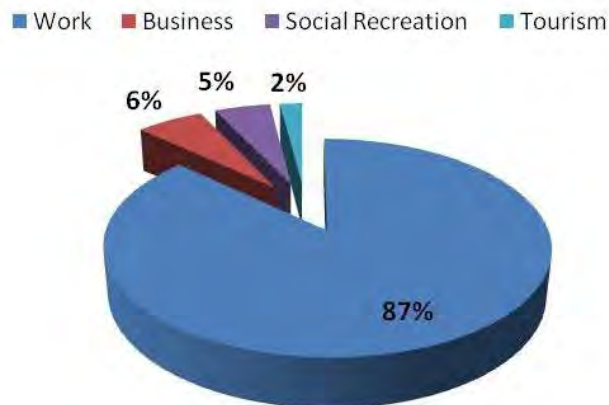

Source: Revised Master Plan for Bangalore-2031, 2015

**Figure 2-16: Trip frequency- Passenger Vehicle at Outer Cordon Location**

**Trip purpose passenger vehicle**

Analyses on purpose of journey revealed that majority of the trips are work related trips as shown in **Figure 2-17**. Most of work trips are originating from (OD 4) NH4 Tumkur Road, (OD 9) Hosur Road and (OD 11) Channasandara Road. Predominant business trip has been observed from (OD 12) Thanisandara Main Road, (OD 8) Bannerghatta Main Road and (OD 1) Bangalore Hyderabad Road.

**Figure 2-17: Trip purpose- passenger vehicle at outer cordon location**

**2.5.3 Parking surveys**

**On Street parking survey (Core Bangalore)**

Organized market places are very limited in the city over the years. Most of the major roads and streets have witnessed mixed land use. This situation with no off-street parking spaces available (except for large shopping malls) resulted in one lane of streets turning to parking lots. This on-street parking is affecting the mobility with reduced road space available for the movement of traffic and the maneuvers of parked vehicles obstruct traffic flow often leading

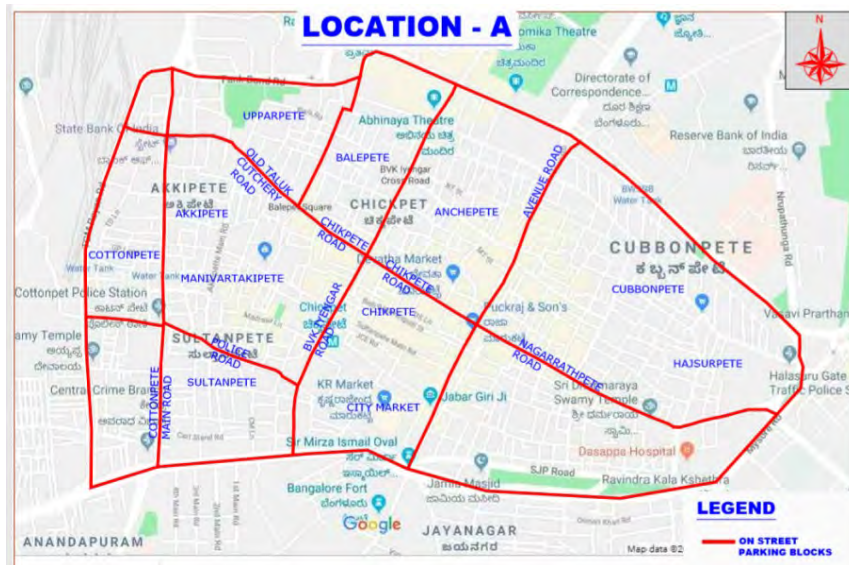

to congestion. Surveys are carried out in some of the areas covering major streets/roads where on-street parking is observed.

**Location- A**

Most of the commercial/ shopping complexes in this location do not have required parking facilities to meet the parking demand of the visitors. It was observed that the road users parked their vehicles on Avenue road, KR market road, SJP road and S.P road. The central business district part of Bangalore, comprising Gandhinagar, Avenue Road, Chickpet, B.V.K. Iyengar Road and surrounding areas, records the highest number of business transactions but lacks adequate parking space. Two wheelers form the major component of the parked vehicles with a share of 82% followed by cars with a share of 7%. From the surveys, it has been observed that the average duration of parking is found to be one hour. On-street parking has reduced the capacity of roads by about 18% to 48%. High parking demand is observed on AS Char Street, BVK Iyengar road, Banappa park road, Chickpet main road, Nagarathpet road, RT Street, SJP road, SP road.

The total Parking accumulation in Location-A is 1795 PCE and high parking accumulation is observed on SJP road, Chickpet Main Road and BVK Iyengar Road.

**Location B**

The area is predominantly a mixed land use with commercial establishments such as several Corporate Offices, Railway Station, Bus Stand and Government Establishments. Bangalore City Railway station is located across the Kempegowda Bus Station in Bangalore.

Two wheelers form the major component of the parked vehicles with a share of 64% followed by cars with 30% share. From the surveys, it has been observed that the average duration of parking is found to be about one hour. On street parking has reduced the capacity of roads by about 8% to 60% on these streets.

High parking accumulation is observed on Kempegowda Road to Seshadri Road, Kalidasa Marg Road to 5th Main Road and SC road. The total Parking accumulation in the roads surveyed in Location-B is 366 PCE.

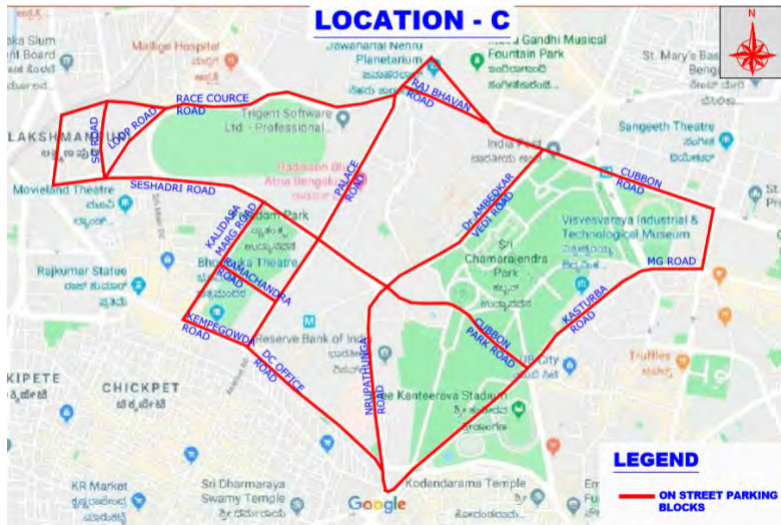

**Location-C**

The area is the Central Administrative Heritage Zone of the City which is the administrative complex for the Government of Karnataka with heritage buildings such as Vidhana Soudha, High Court, Public and Government buildings such as GPO, RBI, PWD Office, Karnataka Police Headquarters Offices and various institutions such as Government Arts and Sciences College, Central College, Home Science College, Seshadri Iyer Memorial Hall or the State Library etc.

In Location-C, cars form the major component of the parked vehicles with a share of 50% followed by two wheelers with 27% share. From the surveys, it has been observed that the average duration of parking is found to be about two hours. On street parking has reduced the capacity of roads by about 7% to 50% .

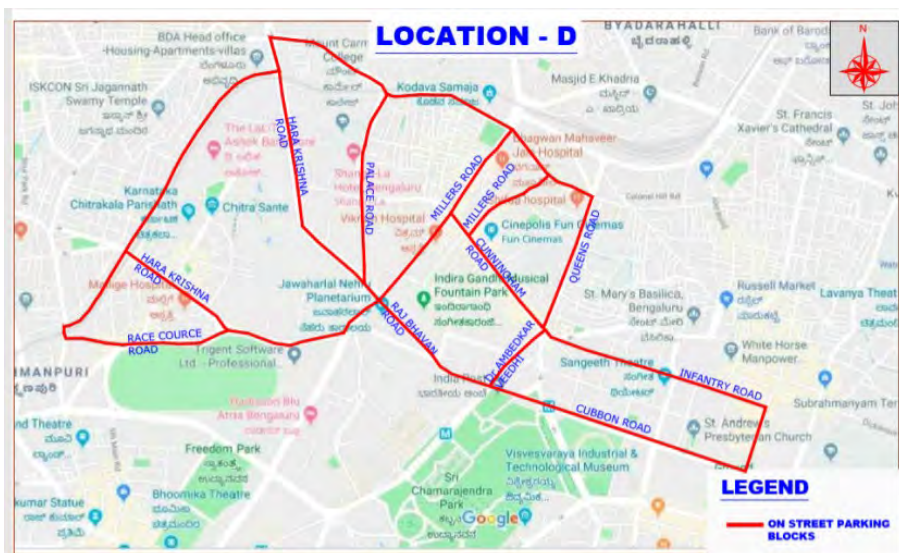

High parking accumulation is observed on Devraj Urs Road, Link road and Ramchandra Road, Race Course Loop Road. The total Parking accumulation in the roads considered under Location-C is 705 PCE.

### Location-D

The area is one of the oldest and most prominent areas of Bangalore. It is basically commercial area and the traffic within the zone is moderate since most of the roads are broad. Cars form the major component of the parked vehicles with a share of 45% followed by two wheelers with share of 41%. From the surveys, it has been observed that the average duration of parking is about two hours.

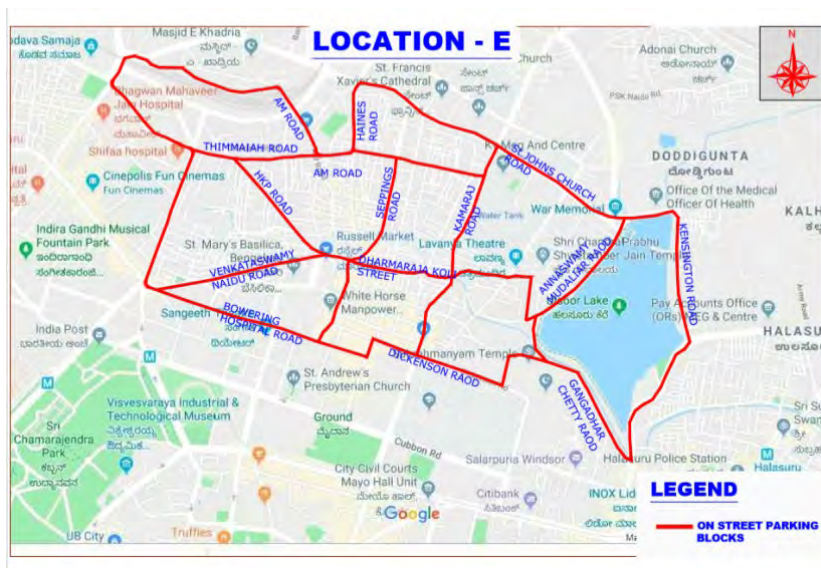

High parking accumulation is observed on Railway Parallel Road, Race Course Road, 8th Main Road, Ali Askar Road and Edward Road. The total Parking accumulation at the surveyed streets in Location-D is 2259 PCE.

**Location-E**

The area is an important commercial center of Bengaluru. Major traffic generators in this zone are the shopping haven Commercial Street, Russell Market Square, St Mary’s Church, Shivajinagar Bus Terminal and educational institutions along St. John’s Church Road. Two wheelers form the major component of the parked vehicles with a share of 65% followed by cars with 22% share. From the surveys, it has been observed that the average duration of parking is found to be about two hours.

High parking accumulation is observed on Anna Swamy Road, Kamraj Road, Osborne Road, Thimmaiah Road, Broadway Road and Seppings Road. The total Parking accumulation at the surveyed roads in Location-E is 2934 PCE.

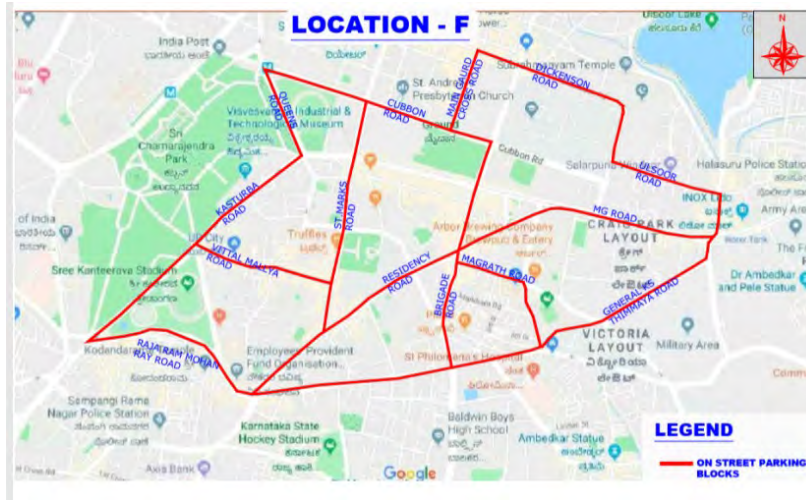

**Location-F**

The area is predominantly Commercial (Business) land use surrounded by various Government, Institutional, Commercial and Private Properties. The major traffic generators include Mayo Hall and Municipal Offices, Manipal Center, Kanteerava Stadium, Cubbon Park, Mallya Hospital, St. Joseph’s College etc.

In Location-F, two wheelers form the major component of the parked vehicles with a share of 52% followed by cars with 43% share. From the surveys, it has been observed that the average duration of parking is found to be about two hours.

High parking accumulation is observed on MG road, Brigade road, Castle street, Lavelle road, Residency road, Church street. The total Parking accumulation observed in the streets surveyed under Location-F is 1243 PCE.

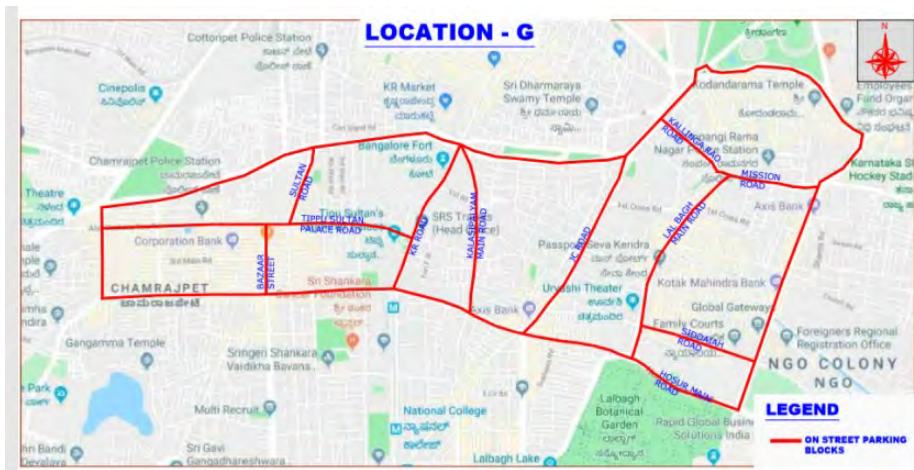

### Location-G

In Location G, two wheelers form the major component of the parked vehicles with a share of 48% followed by car with 27% share. From the surveys, it has been observed that the average duration of parking is found to be about one hour. On street parking has reduced the capacity of roads by about 12% to 55%.

High parking in Location-G is observed on Lalbagh road, 2nd main road, Lalbagh fort road, NR road and Albert victor road. The total Parking accumulation in the roads section studied in Location-G is 875 PCE.

**Table 2-21: Summary of On-Street Parking Accumulation**

| S. No. | Location | Study Areas   | Total Parking Accumulation (PCE) |
|--------|----------|---|----------------------------------|
| 1      | A        | Avenue Road, KR Market Road, SJP Road, S.P Road, Kasturba Road, Sultanpet Main Road etc.  | 1795                             |
| 2      | B        | Kalidasa Marg Road, Anand Rao Circle, Dhanvanthari Road And S C Road  | 366                              |
| 3      | C        | Devraj Urs Road, District Office Road, Kalidasa Marg Road, Kasturba Road, Palace Road, Nrupathunga Road etc.  | 705                              |
| 4      | D        | Race Course Road, Crescent Road, Palace Cross Road, Millers Road, Cunningham Road 2, Aliasker Road, Jasma Bhavan Road, Edward Road, Union Street etc.           | 2259                             |
| 5      | E        | Kensington Road, Annaswamy RD, Dickenson Rd, Kamaraj Rd, Veerapillai Street, Gangadhar Shetty Rd, Osborne Rd, Thimmaiah Road, Chick Bazaar Road, Haines Rd etc. | 2934                             |
| 6      | F        | M G Road, Brigade Road, Brunton Road, Lavelle Road 1, Residency Road, Kasturba Cross Road, Mallya Hospital Road   | 1243                             |
| 7      | G        | Lalbagh Road, Pampa Maha Kavi Road, Lalbagh Fort Road, Nr Road, Albert Victor Road  | 876                              |

*Source: Parking Action Plan for Bangalore, 2015*

Currently the on-street parking is highly unorganized and there is no physical infrastructure or enforcement to ensure orderly parking. The on-street parking being free of charge, the off-street parking facilities (where available) are not used to their full potential. Further, it is to be noted that there are no major off-street parking facilities in these areas.

Further the on-street parking reduces the effective road width available for traffic movement and the ingress/egress operations of parked vehicles obstruct flow of traffic in the available road way width and there by leading to reduced travel speeds and at times accidents. Organized parking would only help in limited way to restrict parking to small known road sections (which are required to be provided through recess in the footpath where space is available) but may not help in eliminating the traffic disturbance due to ingress and egress. Therefore, as far as possible on-street parking should not be allowed on major mobility travel corridors. Where space is available these need to be provided on the service road in an organized manner to limit the impact on traffic movement.

However, the implementation of organized parking and use of Technology has been observed for on-street parking management on brigade road, where local shop association have installed parking meters clearly marking car parking slots on the road space.

**Parking Fee**

Parking today in Bangalore is virtually free on most roads. The parking fee charged on some major roads in the city centre is about Rs. 10 per hour. Parking is charged in most Commercial establishments/ office places and is in the range of Rs. 15 to 30 per hour which is much higher than the on-street parking fees.

Study of some Off-street parking facilities in the Study Area such as Maharaja complex, Janatha Bazaar, Railway Station, Freedom Park, MS Building, Hotel Taj, Shivajinagar Bus Stand, Russel Market, Unity Building and Town Hall was carried and the following **Table 2-22** provides the prevailing pricing for parking at these locations. The facilities are managed by private agencies appointed by Bruhath Bangalore Mahanagara Palike (BBMP).

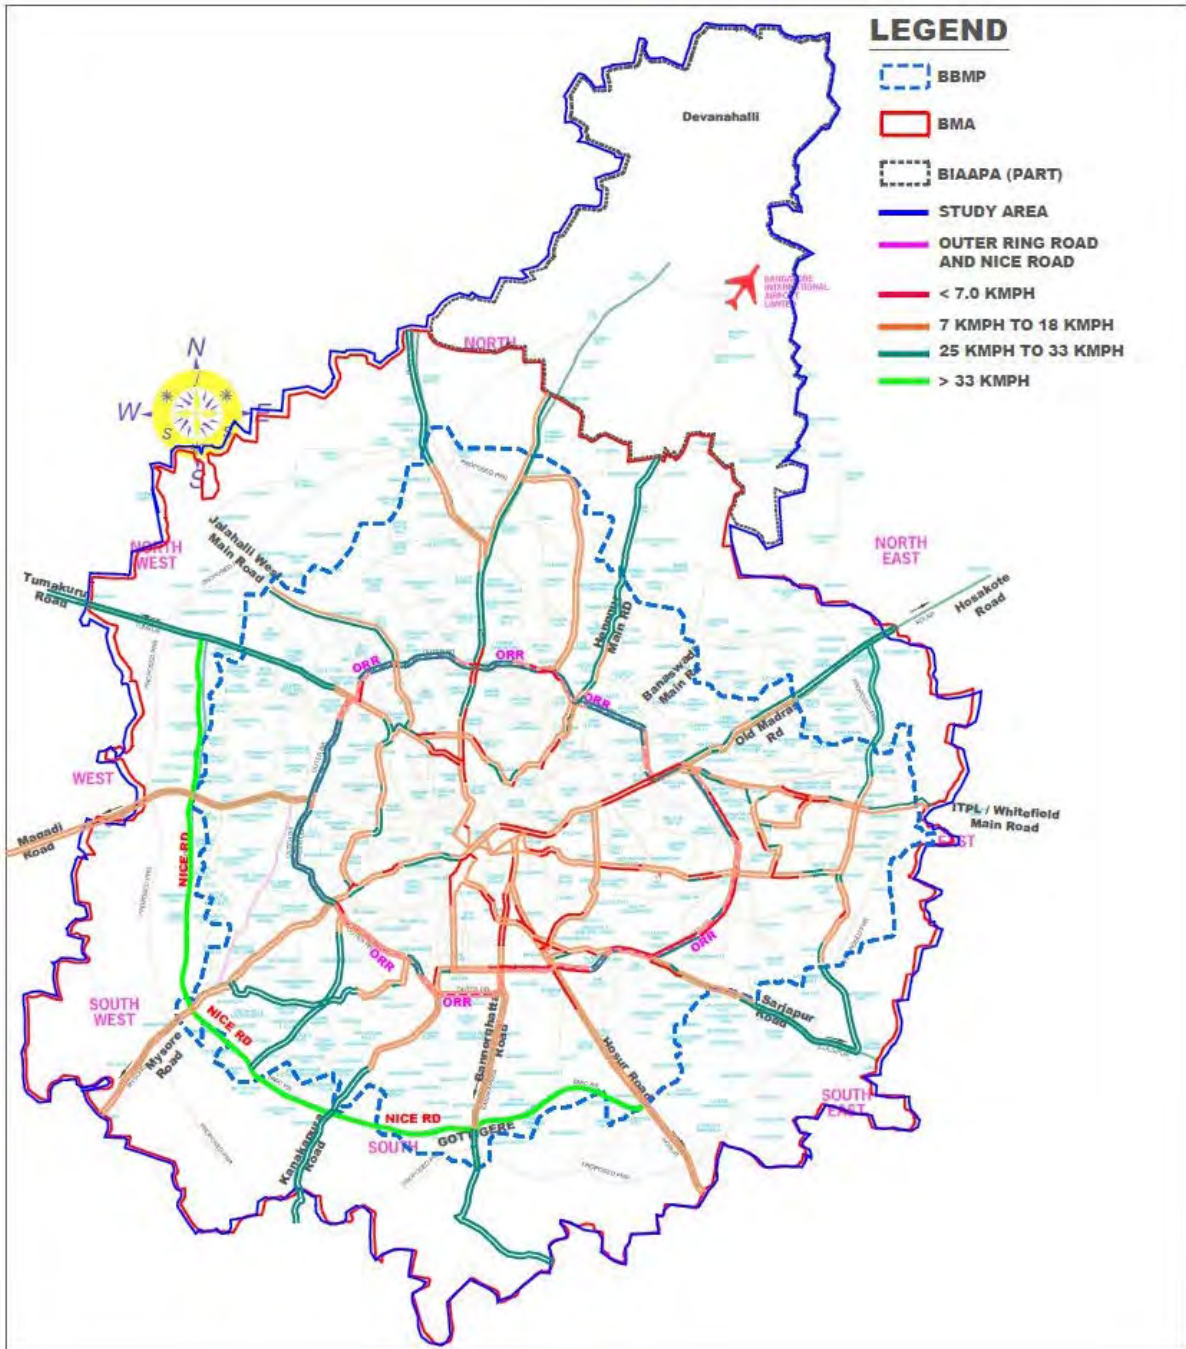

**Table 2-22: Details of Parking fee at some Off-street Parking Areas**

| Sl.No. | Location                    | Parking Fee (Rs./hour) |    |
|--------|-----------------------------|------------------------|----|
|        |                             | Car                    | TW |
| 1      | Maharaja Complex            | 10                     | 3  |

*Source: Parking Action Plan for Bangalore, 2015*

As discussed earlier in Section 2.5.3, there is limited availability of off-street parking which are not being used to their fullest capacity. This is resulting due to uncontrolled and unorganized and free on-street parking facility available for the users. Predominant on-street parking affects the level of service on these roads. Speed and Delays Surveys

Floating car survey (Speed and Delay Survey) was carried out on major arterial roads. It is observed that the speeds in the city road network during peak hours are less than 11 kmph **Figure 2-18** presents the average journey speed on Primary Arterial Roads.

Source: Revised Master Plan for Bangalore-2031

Figure 2-18: Average Journey Speeds on Primary Arterial Roads during peak hour.

### 2.5.4 Boarding / Alighting Surveys

The bus stop passenger survey was conducted at 472 bus stops along different corridors to ascertain travel characteristics of bus passengers. The survey was administered by counting the number of passengers boarding and alighting along with O-D survey on random sampling

basis by interviewing passengers. This survey was conducted at 472 bus stops within the study area for a period of 16 hours. The information included:

- Trip purpose and travel time
- Travel frequency of passengers

**Table 2-23** shows that about 65% of trips are contributed by work and business purpose and about 17% of trips are other purposes.

**Table 2-23: Distribution of Bus Stop Passengers by Trip Purpose**

| Sl. No.      | Trip Purpose | Percentage (%) |
|--------------|--------------|----------------|
| 1            | Service      | 49.1           |
| 2            | Business     | 15.7           |

### 2.5.5 Terminal Surveys

#### *Bus Passenger Survey*

The OD data collected and analyzed at the 16 bus terminals indicates Majestic bus terminal caters to the maximum number of passengers i.e. 70000 passengers as shown in **Table 2-24**. The table further indicates that 2.9 lakh commuters use the bus terminals daily.

**Table 2-24: Distribution of Daily Passengers at Major Bus Terminals**

| Name of Bus Terminal             | Daily            |                   |                 | Peak Hour    |                |                  |
|----------------------------------|------------------|-------------------|-----------------|--------------|----------------|------------------|
|                                  | Passenger Inflow | Passenger Outflow | Total Passenger | Peak Arrival | Peak Departure | Total Passengers |
| Jayanagar 9th Block Bus Terminal | 2295             | 887               | 3182            | 225          | 116            | 341              |

**Rail Passenger Surveys**

The rail passenger surveys were conducted to ascertain travel characteristics of railway passengers within the study area. The survey was administered by counting the number of passengers boarding and alighting the trains along with O-D survey on random sampling basis

by interviewing passengers waiting to board the train at railway stations. This survey was

conducted at one railway station within the study area for a period of 24 hours. The key findings of the survey are presented below.

It is observed from the analysis of rail terminal survey that City Railway Station handling 105210 numbers of passengers with about 8000 passengers boarding/ alighting during the peak hour.

Salient findings are as below:

- ✓ Of the total trips, service and business trips are about 25%
- ✓ Education trips account for about 4% of the total trips
- ✓ In line with the purpose, about 20 % trips are daily commuters while another 11% travel weekly
- ✓ Over 65% of passengers reach railway station by bus followed by Auto which has a share of about 20%
- ✓ A little over 70% spend up to Rs 40 for reaching to or dispersal from station

### ***Air Passenger Surveys***

The air passenger survey is conducted to ascertain travel characteristics of air passengers. The survey was administered by counting the number of passengers boarding and alighting along with O-D survey on random sampling basis by interviewing passengers. This survey was conducted at Kempegowda Airport Terminal Bangalore within the study area for a period of 24 hours. It is observed that Kempegowda Airport caters to about 90,000 passengers per day.

Table 2-28 shows that about 43% of trips are contributed by service and business purpose and about 55% of trips are other purposes.

**Table 2-28 Distribution of Air Passengers by Trip Purpose**

| Sl. No.      | Trip Purpose | Total Passengers | Percentage (%) |
|--------------|--------------|------------------|----------------|
| 1            | Service      | 1518             | 10.0           |
| 2            | Business     | 4931             | 32.6           |

### 2.5.6 Household Interview Survey

Household Interview Survey was carried out on a sample basis as part of the study to get the information spread over the study area. A total of 10167 households have been drawn from all the traffic zones by random sampling method. Stratification of the sample was done to cover various income groups.

The survey format covered the socio-economic profile of the household providing details like household size, education levels, income, vehicle ownership etc. The individual trip information of the members of the household, which provides the details of the trips performed on the previous day, by the household members has also been collected.

The following outputs were derived from the analysis of the household survey.

#### ***Distribution of Household by Size***

Distribution of households according to its family size is presented in **Figure 2-19**. The figure indicates that about 8% of the households have upto 2 members and about 16% of the households belong to the category of households which have 5-6 persons per household. Majority of households (75%) have between 3 to 4 persons per households. The average household size is 3.7 which is less than the average household size in similar sized cities in India.

Source: RITES Study, 2016

Figure 2-19: Distributions of Households According to Size

**Household Income and Expenditure**

It is observed that about nearly 21% of households have monthly income less or equal to Rs. 15000 and another 28% have income between Rs. 15001 – 25,000 per month. The percentage of household having monthly income more than Rs. 25,000 was observed about 51% . Average household income per month in the study area was observed to be Rs. 32374/-

Source: RITES Study, 2016

Figure 2-20: Distributions of Households According to Monthly Income

**Distribution of Households by Average Monthly Expenditure on Transport**

The distribution of the households according to monthly expenditure on Transport is given in **Figure 2.21**. The figure indicates that about 21% of households spend less than or equal to Rs. 1000 per month on transport and nearly 26% have monthly expenditure on transport ranging between Rs. 1501 – 2500. Over 37% of households are having more than Rs. 2500 expenditure per month on transport. Average expenditure on transport per household is estimated as Rs 2473 per month, which is about 7.6% of average household income.

Source: RITES Study, 2016

**Figure 2-21: Distributions of Households According to Average Monthly Expenditure on Transport**

**2.5.7 Modal Share**

Distribution of trips according to mode of travel is presented in **Figure 2.22**. It is observed that about 26% of the trips are walk trips. However, the trips performed by 2 wheelers are about 27% and 32% trips are performed by public transport modes including bus, minibus, school bus chartered bus and metro. The trips performed by auto rickshaw are about 7%. Whereas trips performed by cars/taxi/shared taxis/sumo are about 7%. Per capita trip rate including walk is 1.24, excluding walk is 0.92 and for motorised trips is 0.91.

Source: RITES Study, 2016

Figure 2-22: Modal Split - 2015 (Including NMT Trips)

**Purpose wise Distribution of Trips**

The **Figure 2.23** gives the purpose wise distribution of the trips. It is observed that about 25% of the trips are performed for work and business purpose together, whereas 15% trips are education and about 10% trips which includes shopping, social, health and recreation. About 50% trips are return trips.

Source: RITES Study, 2016

Figure 2-23: Purpose wise Distribution of Trips

**Mode wise Distribution of Trips by Trip Length**

Average trip length by mode of travel is presented in **Table 2-30**. Average trip length for walk is 1.0 Km, for 2-wheeler 8.0 km, for car and taxi is 12.8 km and 13.1 km respectively and for Bus it is about 10.7 km.

**Table 2-30: Mode wise Average Trip Length**

| S. No. | Mode          | Average Trip Length (Km) |
|--------|---------------|--------------------------|
| 1      | Car           | 12.8                     |
| 2      | Taxi          | 13.1                     |
| 3      | Shared Taxi   | 15.4                     |
| 4      | 2- Wheelers   | 8.0                      |
| 5      | Auto          | 3.7                      |
| 6      | Bus           | 10.7                     |
| 7      | Mini Bus      | 10.7                     |
| 8      | School Bus    | 5.1                      |
| 9      | Chartered Bus | 15.1                     |
| 10     | Cycle         | 2.6                      |
| 11     | Walk          | 1.0                      |

Source: RITES Study, 2016

The City sprawl has resulted in increasing average trip length significantly.

**2.5.8 Road Network Inventory**

The main objective of Road Inventory survey is to assess the physical characteristics and conditions of major road network in the study area, identify physical constraints and bottlenecks and to identify the potential future development.

**Right of Way (ROW)**

About 43% of length of roads has ROW up to 10 m and 13% have ROW between 20 to 30 m as indicated in **Table 2-31**. This indicates the limitation of widening on most of the roads.

**Table 2-31: Distribution of Road Length by Right of Way**

| Right Of Way (m) | Road Length (in km) | Percentage (%) |
|------------------|---------------------|----------------|
| Up to 10         | 1078.7              | 42.5           |
| 10-20            | 965.7               | 38.1           |
| 20-30            | 329.9               | 13.0           |
| > = 30           | 163.1               | 6.4            |
| <b>Total</b>     | <b>2537.4</b>       | <b>100.0</b>   |

Source: RITES Phase III Corridors of Bangalore Metro, 2016

### Carriageway Width

The distribution of road network as per carriageway width is presented in **Table 2-32**. It can be observed that about 74% of surveyed road network length has carriage way width up to 2 lanes and about 20% of road network 4 lane and more.

**Table 2-32: Distribution of Road Network as per Carriageway Width**

| S. No.       | Carriageway      | Road Length (Km) | Percentage (%) |
|--------------|------------------|------------------|----------------|
| 1            | Upto 2-Lane      | 1871.0           | 73.8           |
| 2            | 3 Lane           | 160.9            | 6.3            |
| 3            | 4-Lane           | 319.7            | 12.6           |
| 4            | 6- Lane and More | 185.8            | 7.3            |
|              | Divided          | 567.3            | 22.4           |
|              | Undivided        | 1970.0           | 77.6           |
| <b>Total</b> |                  | <b>2537.4</b>    | <b>100.0</b>   |

*Source: RITES Phase III Corridors of Bangalore Metro, 2016*

### Service Roads

It is observed from **Table 2-33** that merely 5% of the road network has service lanes and rest of the network is without service lane. Thus it may be safely concluded that almost all of the primary roads in the city do not have a service road which affects their capacity adversely due to intervention from the activities on the roadside.

**Table 2-33: Distribution of Road Length by Availability of Service Road**

| Service Road | Road Length (in km) | Percentage (%) |
|--------------|---------------------|----------------|
| Present      | 117.6               | 4.6            |
| Absent       | 2419.8              | 95.4           |
| <b>Total</b> | <b>2537.4</b>       | <b>100.0</b>   |

*Source: RITES Phase III Corridors of Bangalore Metro, 2016*

Key findings of the Road Inventory are as following:

- Only 20% of the road network has 4 lanes or more, however when effective width available is considered, the length is very less
- Ring Road network is weak or discontinuous at many locations.
- Parking interference has been observed at many locations in almost all major roads resulting in to reduced effective width available for traffic movement
- Bus bays are not provided on most of the major Roads

### Non-motorized Transport

Footpaths are available along about 47% of the road length as presented in **Table 2-34**. More than half of the road network is without footpaths.

**Table 2-34: Distribution of Road Length by Availability of Footpath**

| Footpath  | Road length (km) | Percentage (%) |
|-----------|------------------|----------------|
| Present   | 1183.7           | 46.7           |
| One-side  | 41.1             | 1.6            |
| Both-side | 1142.6           | 45.0           |
| Absent    | 1353.6           | 53.3           |

Source: RITES Phase III Corridors of Bengaluru Metro, 2016

While almost 50% of the road network has foot path on one side or both sides, utility is limited to much lesser length due to encroachment by shopkeepers and parking, unevenness, damaged footpath etc. Goods Focal Point Survey

Goods Focal Point survey has been carried out to assess the characteristics of movement of goods from large operators. This would act as input for model development, preparation of truck routing /terminal planning. Entry exist surveys at 8 major facilities have been carried out; the details have been presented in **Table 2-35**.

**Table 2-35: Entry / Exit of Goods Vehicle at Surveyed Location**

| Sl. No. | Junction Code | Location | LCV/Tempo | Tractor | 2 - Axle | 3 - Axle | MAV | OTHER |
|---------|---------------|----------|-----------|---------|----------|----------|-----|-------|
| 1       | Concor        | Entry    | 37        | 14      | 124      | 19       | 6   | 6     |
|         |               | Exit     | 4         | 6       | 178      | 2        | 0   | 0     |
| 2       | Devraj URS    | Entry    | 216       | 63      | 210      | 37       | 0   | 0     |
|         |               | Exit     | 190       | 56      | 102      | 111      | 5   | 0     |
| 3       | Tumkur TCI    | Entry    | 11        | 16      | 16       | 9        | 8   | 0     |
|         |               | Exit     | 11        | 9       | 29       | 1        | 8   | 1     |
| 4       | Tumkur VRL    | Entry    | 3         | 5       | 126      | 1        | 0   | 0     |
|         |               | Exit     | 6         | 0       | 131      | 9        | 0   | 0     |
| 5       | Yeswanthpura  | Entry    | 116       | 29      | 14       | 7        | 5   | 0     |
|         |               | Exit     | 63        | 16      | 10       | 12       | 2   | 0     |
| 6       | Mysore Road   | Entry    | 56        | 57      | 25       | 3        | 0   | 0     |
|         |               | Exit     | 51        | 48      | 15       | 2        | 0   | 0     |
| 7       | Bidadi        | Entry    | 0         | 11      | 0        | 0        | 0   | 30    |
|         |               | Exit     | 2         | 8       | 0        | 0        | 0   | 35    |

| Sl. No. | Junction Code          | Location | LCV/Tempo | Tractor | 2 - Axle | 3 - Axle | MAV | OTHER |
|---------|------------------------|----------|-----------|---------|----------|----------|-----|-------|
| 8       | Kadugodi - White Field | Entry    | 22        | 10      | 10       | 2        | 2   | 0     |
|         |                        | Exit     | 37        | 14      | 124      | 19       | 6   | 6     |

Source: Revised master Plan for Bangalore-2031,2015

### Goods Type

It has been observed that most of commodity type goods coming and going from Bengaluru is perishable goods followed by Industrial material, manufactured materials and tankers, refer **Figure 2.24**.

Source: Revised master Plan for Bangalore 2031

**Figure 2-24: Types of Goods at Goods Focal Point**

### Mode-wise Occupancy

Average Bus occupancy varied from 36 to 39 with overall average occupancy at 37.5. Average occupancy for cars, two wheelers and auto rickshaws is about 2.3, 1.5 and 1.8 respectively. The mini buses have an average occupancy of about 15.

#### Key findings:

- More than 20% truck entering or exiting Bengaluru are originating from these eight locations.
- Average Loading Capacity at these facilities is 10.80 Tonnes
- Limited parking at these goods facilities have forced trucks to be parked on street

## 2.6 Summary of Existing Traffic and Transport Conditions

The key findings of all the surveys indicate that all roads within the outer ring road boundary are facing severe congestion during the peak hours leading to gridlocks. One of the primary

reasons for traffic congestion is the low capacity of Bangalore roads that are facing the brunt of the ever-bludgeoning traffic growth.

Even the smaller roads intersecting the main arteries are congested leading to large delays at intersections, reducing the speeds significantly. With on street parking being rampant and haphazard there is a severe reduction in the available road capacity for vehicular movement.

Lack of off-street parking is one of the major banes of Bangalore and needs immediate attention to regain the dead capacity because of on-street parking. The parking and non-parking maneuvers cause severe impedance to smooth flow of traffic.

The signalized intersections throughout the city are operating on fixed time mode that is hampering smoother and speedier clearance of traffic at intersections. As evident from the traffic congestion on the city roads, the operating speeds are dismally low in the city road network within the outer ring road boundary. The inner and outer ring roads are no exception as far as congestion goes. A few radials (Bannerghatta Road, Magadi Road, Kanakapura Road and old Madras Road) on stretches outside the outer ring road precincts also face severe congestion. The East-West connectivity is weak in Bangalore as far as road network is concerned.

Important observations from the survey analyses are presented in the following section.

### 2.6.1 Traffic Characteristics

#### *Peak Hour Traffic Volume at Screen line locations*

The peak hour volume varies from 627 PCUs (798 vehicles) at Gunjur Road to 10699 PCUs (11989 vehicles) at Old Mysore Road.

#### *Outer Cordon Road Side Interview Survey*

- (i) Of the surveyed outer cordon locations NH-7 (Hosur Road) has the highest number of vehicles at about 97339 PCUs (71374 vehicles) followed by NH-4 (Old Madras Road) with 76626 PCUs (58611 vehicles).
- (ii) The share of cars varies between 16% and 75% for the different locations and two wheelers vary from 8% to 59%. The percentage of trucks/ multi axle vehicles varies from 6% to 29% at various locations. Tumkur Road (NH4) has the highest percentage of goods vehicles at 29%.
- (iii) The percentage share of Passenger and Goods traffic at the surveyed locations are 83 % and 17 % respectively
- (iv) The inbound and outbound Goods Traffic volume at surveyed locations has been observed are 30,209 and 34,773 respectively
- (v) The total goods movement observed from the outer cordon survey was 64981 out of which 44% is the inbound traffic (External to Internal movement) and 36% is out bound goods movement (Internal to External) and rest of 20% is the by passable traffic
- (vi) It has been observed that maximum amount of Industrial Material carried by commercial vehicle from (OD 4) NH4 Tumkur Road followed by (OD7) Kanakapura

Road and (OD 9) Hosur Road. Perishable (Food Grains/ vegetables are carried by commercial vehicles from OD 13 Old Madras Road and OD 6 Mysore Road).

- (vii) Analyses on purpose of journey revealed that majority of the trips are work related trips as. Most of work trips are originating from (OD 4) NH4 Tumkur Road, (OD 9) Hosur Road and (OD 11) Channasandara Road. Predominant business trip has been observed from (OD 12) Thanisandara Main Road, (OD 8) Bannerghatta Main Road and (OD 1) Bangalore Hyderabad Road.

## 2.6.2 Public Transport Characteristics

### *Bus Passenger Surveys*

The salient features of the surveys are given below.

- (i) About 2.9 lakhs commuters use the inter or intra city bus terminals daily. Majestic bus terminal caters to the maximum number of passengers i.e. 70000 passengers.
- (ii) It is observed that about 65% of passengers use buses for their work and business purpose and about 12% of passengers uses it for education purpose.
- (iii) About 56% passengers are dispersing through buses. Share of passenger dispersal by walk and auto rickshaw is about 39% and 2% respectively

### *Rail Passenger Surveys*

The salient findings of the surveys are discussed below.

- (i) It is observed from the analysis of rail terminal survey that City Railway Station handles 1.05 Lakh numbers of passengers daily.
- (ii) Out of 1.1 lakh trips of passengers, work & business purpose trips are about 25% followed by about 4% for education purpose.
- (iii) About 65% passengers are dispersing through buses. Share of passenger dispersal by Auto is about 20% .

### *Air Passenger Surveys*

The salient features of the surveys are given below.

- (i) It is observed that Kempegowda Airport caters to about 90,000 passengers per day.
- (ii) About 72% passengers are dispersing through Car and Taxis/IPT. Share of passenger dispersal by buses is about 28% .

## 2.6.3 Household Interview Survey

The entire study area has been divided into 215 internal and 10 external traffic zones. A total of 10167 households have been drawn from all the traffic zones by random sampling method.

### **Socio Economic Characteristics**

Various existing socio-economic characteristics viz. distribution of the households according to household size, household income, vehicle ownership, distribution of the individuals by their occupation, education and expenditure on transport etc. are derived from analysis of the household interview survey.

- (i) The average household size is 3.7 persons per household.
- (ii) Nearly 16% of households have no vehicle. About 20% of the household have one car. About 60% of households have at least 1 scooter/motor cycle.
- (iii) Average household income per month in the study area was observed to be Rs. 32374/-.
- (iv) Average expenditure on transport per household is estimated as Rs 2473 per month, which is about 7.6% of average household income.

**Travel Characteristics**

- (i) A total of 12.60 Lakh peak hour trips are being performed everyday by the residents of study area. The modal split of motorized trips is shown in Table 2-36.

**Table 2-36 : Modal Split (Motorised Trips)**

| Sl.No.       | Mode  | No. of Trips (Peak hour) | Percentage (%) |
|--------------|---|--------------------------|----------------|
| 1            | Car/Taxi  | 264649                   | 21.0%          |
| 2            | 2-Wheeler   | 296468                   | 23.5%          |
| 3            | Auto Rickshaw   | 96655                    | 7.7%           |
| 4            | Public Transport (Bus, Mini Bus, School Bus, Chartered Bus) | 601861                   | 47.8%          |
| <b>TOTAL</b> |   | <b>1259633</b>           | <b>100%</b>    |

- (ii) Per capita trip rate including walk is 1.24, excluding walk is 0.92 and for motorized trips is 0.91.
- (iii) Average trip length for walk is 1.0 Km, for 2-wheeler 9.8 km, for car and taxi is 10.2 km and 13.1 km and for Bus it is about 12 km.

**2.6.4 Road Inventory and Speed & Delay Survey Characteristics**

The total length of coded road network is 2537 Km with average link length of 1.1 km. The summary of road network and speed & delay characteristics as emerging from these surveys is presented in subsequent paragraphs.

- i. About 43% of roads have ROW up to 10 m and only 13% has ROW between 20 to 30 m. This indicates the limitation of widening for most of the roads.
- ii. It can be observed that about 74% of surveyed road network length has carriageway width up to 2 lanes and only about 20% of road network 4 lane and more.
- iii. Footpaths are available along about 47% of the road length. Thus the majority length of road network is without footpaths.
- iv. It is observed that the speeds on the city road network are mostly less than 20 kmph while the core area of Bangalore operates at very low speeds (less than 11 kmph) in the peak hour.

**2.7 Service Level Benchmarking**

Benchmarking is a tool used by public agencies to make more informed decisions regarding the performance, make comparisons internally and with other organizations and continuously

improve performance using the lessons learned through this comparison process. Benchmarking helps to establish baseline measures of performance, and helps monitor the agency's individual performance over time, and also how it compares with the other organizations, and also improving performance by sharing of lessons learnt from different entities.

## Need for Benchmarking

The National Urban Transport policy (NUTP) 2006 highlights the crucial link between transport demand and land use planning and the need to develop an integrated mobility plan for each city. Accordingly, each city should develop comprehensive mobility plan with focus on accessibility, mobility and traffic flow (in that order). Rather than the present approach of "predict and provide" it has to be "Planning for the desirables". However, there need to be some yardstick to measure and compare the effectiveness of policies and urban projects across cities. Urban agencies in India currently do not have any system for measuring performance of urban transport activities, assessing impacts of projects and taking further action on them. Kochi is no exception to this. The service level benchmarks (SLB) issued by MoHUA specify parameters to measure the effectiveness of land use transport planning in Bangalore.

The SLBs describe the levels of transport performance like safety and access, pollution, accidents, congestion etc. in Bangalore currently. They indirectly reflect the state of governance in the city. Above all, these benchmark indicators allow stakeholders to quantify the past, present and changes in transport and its sustainability.

## Performance Benchmarks for Urban Transport

Service level benchmarks have been identified for the following parameters by the Ministry of Housing and Urban Affairs (MoHUA):

### Public transport facilities

- Presence of organized public transport system in urban area (%)
- Extent of supply availability of public transport
- Service coverage of public transport in the city
- Average waiting time for public transport users (mins)
- Level of comfort in public transport
- Percentage of fleet as per urban bus specification

### Pedestrian infrastructure facilities

- Signalized intersection delay (%)
- Street Lighting (Lux)
- Percentage of city covered

### Non-Motorized Transport (NMT) facilities

- Percentage of network covered
- Encroachment on NMT roads by vehicle parking (%)
- NMT parking facilities at interchanges (%)

## Level of usage of Intelligent Transport System (ITS) facilities

- Availability of traffic surveillance (%)
- Passenger Information System (PIS) (%)
- Global Positioning System (GPS)/ General Pocket Radio Service (GPRS) (%)
- Signal Synchronization (%)
- Integrated ticketing System (%)

## Travel speed (Motorized and Mass Transit) along major corridors

- Average travel speed of personal vehicles (Kmph)
- Average travel speed of public transport (Kmph)

## Availability of parking spaces

- Availability of on street paid public parking spaces (%)
- Ratio of maximum and minimum parking fee in the city

## Road Safety

- Fatality rate per lakhs population
- Fatality rate for pedestrian and NMT (%)

## Pollution levels

- Sulphur di Oxide (So<sub>2</sub>)
- Oxides of Nitrogen
- Suspended Particulate Matter (SPM)
- Respirable Suspended Particulate Matter (RSPM) (Size less than 10 microns)

## Integrated land use transport system

- Financial Population Density – Gross (Persons/Developed area in hectare)
- Mixed Land-use on Major Transit Corridors / Network (% area under nonresidential use)
- Intensity of Development – City wide (FSI)
- Intensity of development along transit corridor (FSI transit corridor/FSI)
- Clear Pattern and Completeness of the network
- Percentage of area under Roads
- Percentage of network having exclusive ROW for Transit network

## Financial sustainability of public transport

- Extent of Non fare Revenue (%)
- Staff /bus ratio
- Operating Ratio

The Detailed calculation is presented below.

**PUBLIC TRANSPORT FACILITIES****(a) PRESENCE OF ORGANIZED PUBLIC TRANSPORT SYSTEM IN URBAN AREA (%)**

Bangalore's public transportation system is operated and maintained by Bangalore Metropolitan Transport Services (BMTC). At present, the city has 6634 buses operated on 2842 routes.

A = Total Number of Buses in the City operating – 6634 buses

B = Total Number of operating Buses under the ownership of STU/SPV - 6634 buses

Presence of Organized Public Transport System in Urban Area (%) =  $(B/A) * 100$

= 100 % , therefore corresponds to LoS 1

**(b) EXTENT OF SUPPLY AVAILABILITY OF PUBLIC TRANSPORT (AVAILABILITY OF PUBLIC TRANSPORT / 1000 POPULATION)**

The Estimated Population of study area for the year 2016 is 110.52 lakhs

A = Total Number of Buses in the City – 6161 buses

B = Total Population of the Study area – 110.52.

Availability of Public Transport / 1000 Population =  $A / (B/1000) = 0.50$ , Therefore corresponds to LoS = 2

**(c) AVERAGE WAITING TIME FOR PUBLIC TRANSPORT USERS (MINS)**

The average headway for each bus route is about 25.26 minutes.

Therefore, the average waiting time is half the headway i.e. 12.63 minutes, therefore corresponds to LoS 4.

**(d) LEVEL OF COMFORT IN PUBLIC TRANSPORT (FROM PREVIOUS CMP)**

Load factor was calculated for different routes (Peak and Off peak hours). From the calculated load factor distribution table was prepared. The average value obtained from the distribution is about 0.72. Therefore, corresponds to LoS 1.

**(e) % OF FLEET AS PER URBAN BUS SPECIFICATION**

A = Total Number of Buses in the City operating – 6634 buses

B = Total number of buses as per the Urban Bus specifications in the city operating – 6634 buses

% of fleet =  $(B/A) * 100 = (6634/6634) * 100 = 100%$  , Therefore corresponds to LoS 1.

The overall LoS of Public Transport Facilities is obtained by summing up the LoS of individual parameters, thus overall LoS corresponds to 2.

**TRAVEL SPEED (MOTORIZED AND MASS TRANSIT) ALONG MAJOR CORRIDORS**

## **AVERAGE TRAVEL SPEED OF PERSONAL VEHICLES (KMPH)**

From the speed and delay survey for private vehicles, the average journey speed for major corridors for the private vehicles = 11 Kmph. Therefore, corresponds to LoS 4.

## **AVERAGE TRAVEL SPEED OF PUBLIC TRANSPORT (KMPH)**

From the speed and delay survey for public transport, the average journey speed for major corridors for the public transport = 8 Kmph. Therefore, corresponds to LoS 4.

Overall Level of Service of Travel Speed facilities city wide =  $3+3 = 6$  (score) = LOS 3

The overall LOS =  $4+4 = 8$  (score) this corresponds to LoS 4

## **AVAILABILITY OF PARKING SPACES**

This indicator represents the availability of paid on-street parking spaces for all vehicles in the Bangalore. Paid on-street parking facility is not yet introduced in Bangalore city except in some off-street locations like Bus stands, railway stations and other commercial complexes. In some places like Malls parking is maintained by private people.

As the percentage is negligible it is considered as  $< 25\%$ . Therefore, LoS 1 = 4.

The ratio of maximum and minimum parking fee is 1 for Bangalore city. Therefore, LoS 2 = 4.

Overall score:  $4+4 = 8$  this corresponds to LoS 4.

## **ROAD SAFETY**

Fatality rate per lakh population

Fatality Rate per Lakh of Population (%)

Accident Data for the entire city was collected from Traffic police, Calculation was done only based on 2017 data and the corresponding year population.

A = Total number of fatalities recorded in road accidents within city limits in the given calendar year = 661 (in nos.)

B = Population of the Bangalore – 118 (Estimated) (in Lakhs)

Fatality rate per 100000 Population (ratio) =  $(A \times 100000) / (B)$

= 5.6

This corresponds to LOS 3.

## **POLLUTION LEVELS**

The indicator indicates the level of air pollutants in the city i.e., average level of pollution in urban areas. The indicator to calculate the pollution level is Mean Concentration Range.

The pollution data that needs to be collected includes:

Sulphur Dioxide(SO<sub>2</sub>)

Oxides of Nitrogen

Suspended Particle matter (SPM)

RSPM (Size less than 10microns)

The level of service for the pollutants is divided into four categories i.e., low, moderate, high and critical. The level of service for each of the above parameters is determined using the table below as recommended by MoUD /MoHUA

For Bangalore city, the pollution levels data is available for the year 2018 and is as shown below  
Oxides of Sulphur: 4, this corresponds to LoS 1

Oxides of Nitrogen: 11, this corresponds to LoS 1

SPM: 170, this corresponds to LoS 1

RSPM (Size less than 10 microns): 90, This corresponds to LoS 3

Overall level of service of pollution city wide = LoS 1+ LoS 2+ LoS 3 + LoS 4 = 1+1+1+3=6, this corresponds to LoS 2.

## **INTEGRATED LAND USE TRANSPORT SYSTEM**

POPULATION DENSITY – GROSS (PERSONS/DEVELOPED AREA IN HECTARE)

A = Area (in Hectare) of study area= 1,30,700 hectares

B = Population of the year (2016) for which data is available = 110.52 lakhs  
Population density (No.) = B/A

= 34,30,000 /1,55,000 = 84.56. Therefore, corresponds to LoS 4.

## **MIXED LAND-USE ON MAJOR TRANSIT CORRIDORS / NETWORK (% AREA UNDER NON-RESIDENTIAL USE)**

A= Mixed use Development along Transit corridors=815 kms  
B=Total road length (Transit corridor) = 2537km

A/B\*100= (815/2537) \*100= 32%, Therefore corresponds to LoS 1.

## **INTENSITY OF DEVELOPMENT – CITY WIDE (FSI)**

As per the Development Plan Floor Space Index (FSI) as applicable to the developed area lies in the range of 1.00 - 1.5. Normally, FSI varies due to plot size, ground coverage and road width.

Floor Space Index is between 1.0 to 1.5, Therefore corresponds to LoS 3.

The entire network in Bangalore city has a somewhat clear pattern but somewhat incomplete network as many the peripheral locations are not well connected.

Hence LoS 5 = 2.

### **INTENSITY OF DEVELOPMENT ALONG TRANSIT CORRIDOR (FSI TRANSIT CORRIDOR/FSI)**

A = Floor Space Index (Applicable to most part of the city as per master plan is 1.0 to 1.5. B = FSI for the proposed transit corridor is also 1.0 TO 1.5

Intensity of development along transit corridor =  $B/A = 1$ , Therefore corresponds to LoS 3.

### **% OF AREA UNDER ROADS (%)**

As per master plan, the average area under transport and communication for Bangalore City area is around 7.29%. Therefore, LoS = 4

### **% NETWORK WITH EXCLUSIVE ROW FOR TRANSIT (FOR > 1 MILLION AS PER 2016 CENSUS)**

A = total Length of roads= 14400 km

B = Total length of road having exclusive transit = 0 kms

% network with exclusive ROW for transit =  $B/A * 100 = 0$ , Therefore LoS = 4

**Overall Level of Service of Integrated Land use system= LoS 1+ LoS 2 + LoS 3 + LoS 4 + LoS 5 + LoS 6 + LoS 7= 4+ 1+2 +2+ 3 + 4 + 4 = 20, this corresponds to overall LOS 3.**

### **SUSTAINABILITY OF PUBLIC TRANSPORT**

#### **EXTENT OF NON FARE REVENUE (%)**

Performance of Bangalore City Transport Services Limited had been collected as a secondary data collection.

A = Revenue collections per annum from non-fare related sources (i.e. excluding tariff box collections) - 462.29 crore

B = Total revenue per annum from all the sources i.e. majorly fare 100% Extent of non-fare revenue (%) = 2227 crores

$A/B * 100 = 20\%$ , Therefore LoS 2

#### **STAFF /BUS RATIO**

A = Total staff of bus operation and maintenance – > 34114

B = Total number of buses – 6677 (in Number)

Staff / Bus Ratio (ratio) = A/B = 5.1, Therefore LoS 1

**OPERATING RATIO**

A = Operating expenses/bus – Rs. 39.58 lakhs

B = Ticketing revenue/bus – Rs. 27.54 lakhs

Operating ratio = A/B = 1.44, Therefore LoS 3

Overall score: 2+1+3 = 6 this corresponds to overall LoS 2.

The summary of the LOS calculated for the study area is presented in **Table 2-37**.

**Table 2-37 : Summary of Service Level Bench Mark**

| Description  | Existing LOS | Remarks  |
|--|--------------|--|
| <b>Public Transport Facilities</b>                                     | 2            | The city has Public Transport system which may need considerable improvements in terms of supply of buses/coaches and coverage as many parts of the city are not served by it. The frequency of the services may need improvements                         |
| <b>Non Motorised Transport (NMT) facilities</b>                        | 4            | The city lacks adequate NMT facilities.  |
| <b>Travel speed (Motorized and Mass Transit) along major corridors</b> | 4            | Significant approach delays and average travel speed of 1/3 the free flow speed or lower. Such condition causing combination of one or more reasons such as high signal density, extensive queuing at critical intersection and appropriate signal timing. |
| <b>Parking spaces</b>  | 4            | The city authority need to initiate immediate actions with respect to providing paid parking spaces and demand management for parking.   |
| <b>Road Safety</b>   | 3            | Need considerable improvements in Road design and available road infrastructure, traffic management and in other such reasons which significantly contribute to road safety.   |
| <b>Pollution levels</b>  | 2            | Need some improvement in emission standards, checking pollution etc.   |
| <b>Integrated land use transport system</b>                            | 3            | Faint coherence between study area structure and public transport system.  |
| <b>Sustainability of Public Transport</b>                              | 2            | The Public transport is financially sustainable but needs some improvement.  |

### 3 TRANSPORT DEMAND ASSESSMENT AND DEVELOPMENT OF SUSTAINABLE URBAN TRANSPORT SCENARIOS

The main focus of the study is to develop a long-term transportation strategy for Bengaluru with the help of an urban transport planning model. Transport Demand Modelling has been carried out to replicate the Bengaluru “real” transportation system and forecasting the state of the system for the targeted horizon year (2051) under various scenarios. This chapter discusses the development of alternative scenarios and their evaluation with outputs of travel demand modelling.

#### 3.1 BUSINESS AS USUAL (BAU) SCENARIO

The CMP considers Business as Usual Scenario (BAU) for 2031 wherein the present base year trends are assumed to continue for the horizon years with minimum changes to occur in the future. This scenario assesses the transport system with base year trends and assumes no radical policy interventions for sustainable development and emission mitigations to identify the effects on travel infrastructure, mode share and PT systems in the city. However, it does incorporate infrastructure, Mass Transit System and land use according to the Revised Master Plan.

##### 3.1.1 Accordingly, the BAU scenarios is evaluated using Committed Projects alone. Travel Demand Model Development

The Travel demand model developed for the preparation of Revised Master Plan 2031 has been adopted for this study. A brief description of the Transport Demand Model (as was carried out in the Master Plan Revision) is presented in **Annexure 3.1**.

##### 3.1.2 Socio-Economic Transitions

Bengaluru has a long history, but the recording of census of population in Bengaluru began from 1871. It is notable here that since the first census, Bengaluru has been the most populous city in the State of Karnataka. Bengaluru has retained its primacy in the state for more than a century now. RMP-2031, given the available census information, has extracted population data for the unified area (BMA) for the past four decades i.e. 1971 to 2011. Census information broadly coincides with the formation of BDA in 1976 and that the Jurisdiction of BMA has remained constant for all these years except for modifications due to administrative changes. However, the municipal boundaries/ urban agglomeration has changed every decade. In case of BBMP, present municipal boundaries have been used to arrive at historical data for BBMP.

As already presented in Section 1.4, the study area for CMP includes BMA and part of BIAAPA (Jala and Kasba Hoblis). BMA comprises area under BBMP and 251 villages around the BBMP. For the BIAAPA area, the authority has prepared master plan to guide the development in the area. The census data pertaining to the BMA (BBMP and Villages) and parts of BIAAPA has been used for extraction and analysis of population. For projections, relevant master plans and the population growth rates for further projections has been used.

The Revised Master Plan-2031 has carried out projections for the spatially constant Bengaluru Metropolitan Area. The projected population for the BMA and the extended area is shown in **Table 3-1. The methodology of population projections is given in Annexure 3.2**

**Table 3-1: Summary of forecasted Population**

|               | 2015              | 2031              | 2041              | 2051              |
|---------------|-------------------|-------------------|-------------------|-------------------|
| BMA           | 11,227,977        | 20,313,499        | 25,709,017        | 31,636,758        |
| Extended Area | 255,449           | 550,000           | 895,892           | 1,604,406         |
| <b>Total</b>  | <b>11,483,426</b> | <b>20,863,499</b> | <b>26,604,909</b> | <b>33,241,165</b> |

### 3.1.3 Land use Transitions

Under the revision of master plan, three land use scenarios were analyzed and evaluated apart from the Business as usual scenario. The business as usual scenario considered that there will be no interventions on the direction and randomness on the present growth pattern and both densification and spread will be uncontrolled. Three scenarios were developed as under:

#### *Land use Scenario 1*

The containment scenario tried to contain the growth of the city with a huge emphasis on the environment. The green spaces on the periphery of the city were proposed to be protected. The growth was restricted to about 1.6 crores.

#### *Land use Scenario 2*

The Transit Oriented Development scenario allowed growth mainly along the proposed transit corridors. This allowed a population of more than 2 crores.

#### *Land use Scenario 3*

The differential scenario was a judicious mix of both the containment and the TOD scenarios, where due credence to the National Green Tribunal buffers was given. However, high density nodes called special development zones were also provided in the periphery of the city along major Transport Corridors.

These options along with appropriate transport networks were analyzed. Eight public consultation meetings and 32 stakeholder meetings were carried out to elicit comments. The differential scenario, option 3 was selected as the preferred option. To a large extent, the proposals of this CMP are being drawn from the RMP 2031 outcome duly considering the comments of the public meetings.

**Figure 3-1** presents the proposed land use plan from RMP-2031 for the entire LPA of BDA and the proposed land use break-up for conurbation limit of RMP 2031 is given in **Table 3-2**.

**Table 3-2: Proposed Land use-2031**

| Landuse Category               | Area (Sq.km)   | % To Total Developable Area |
|--------------------------------|----------------|-----------------------------|
| Residential                    | 450.69         | 37.34                       |
| Commercial                     | 27.88          | 2.31                        |
| Industrial                     | 44.90          | 3.72                        |
| Public & Semi Public           | 58.66          | 4.86                        |
| Public & Semi Public - Defense | 43.12          | 3.57                        |
| Public Utility                 | 4.32           | 0.36                        |
| Parks / open spaces            | 29.71          | 2.46                        |
| Transport & Communication      | 120.77         | 10.01                       |
| Forest                         | 4.71           | 0.39                        |
| Water Bodies and Streams       | 40.75          | 3.38                        |
| NGT Buffer                     | 76.36          | 6.33                        |
| <b>Total Developable Area</b>  | <b>901.87</b>  | <b>74.73</b>                |
| Agriculture Zone               | 305.05         | 25.27                       |
| <b>Total</b>                   | <b>1206.92</b> | <b>100.00</b>               |
|                                |                |                             |
| BMICAPA                        | 79.14          | -                           |
| Jala & Kasba Hobli             | 227.85         | -                           |
| <b>Total Conurbation Area</b>  | <b>1513.91</b> | -                           |

Source: Revised Master Plan for Bengaluru - 2031 (Draft): Volume-3

The Conurbation extends mainly to Jala & Kasba Hobli. The rest of the land use is majorly Agriculture.

# LAND USE PATTERN

Figure 3-1: Land-Use Proposed for 2031 (BMA Area)

### 3.1.4 Business as Usual Scenario (Do Minimum)

In “Do Minimum” Business as Usual (BAU-DM) scenario, the existing road network with committed development projects are considered. The list of committed projects proposed by various departments includes the following:

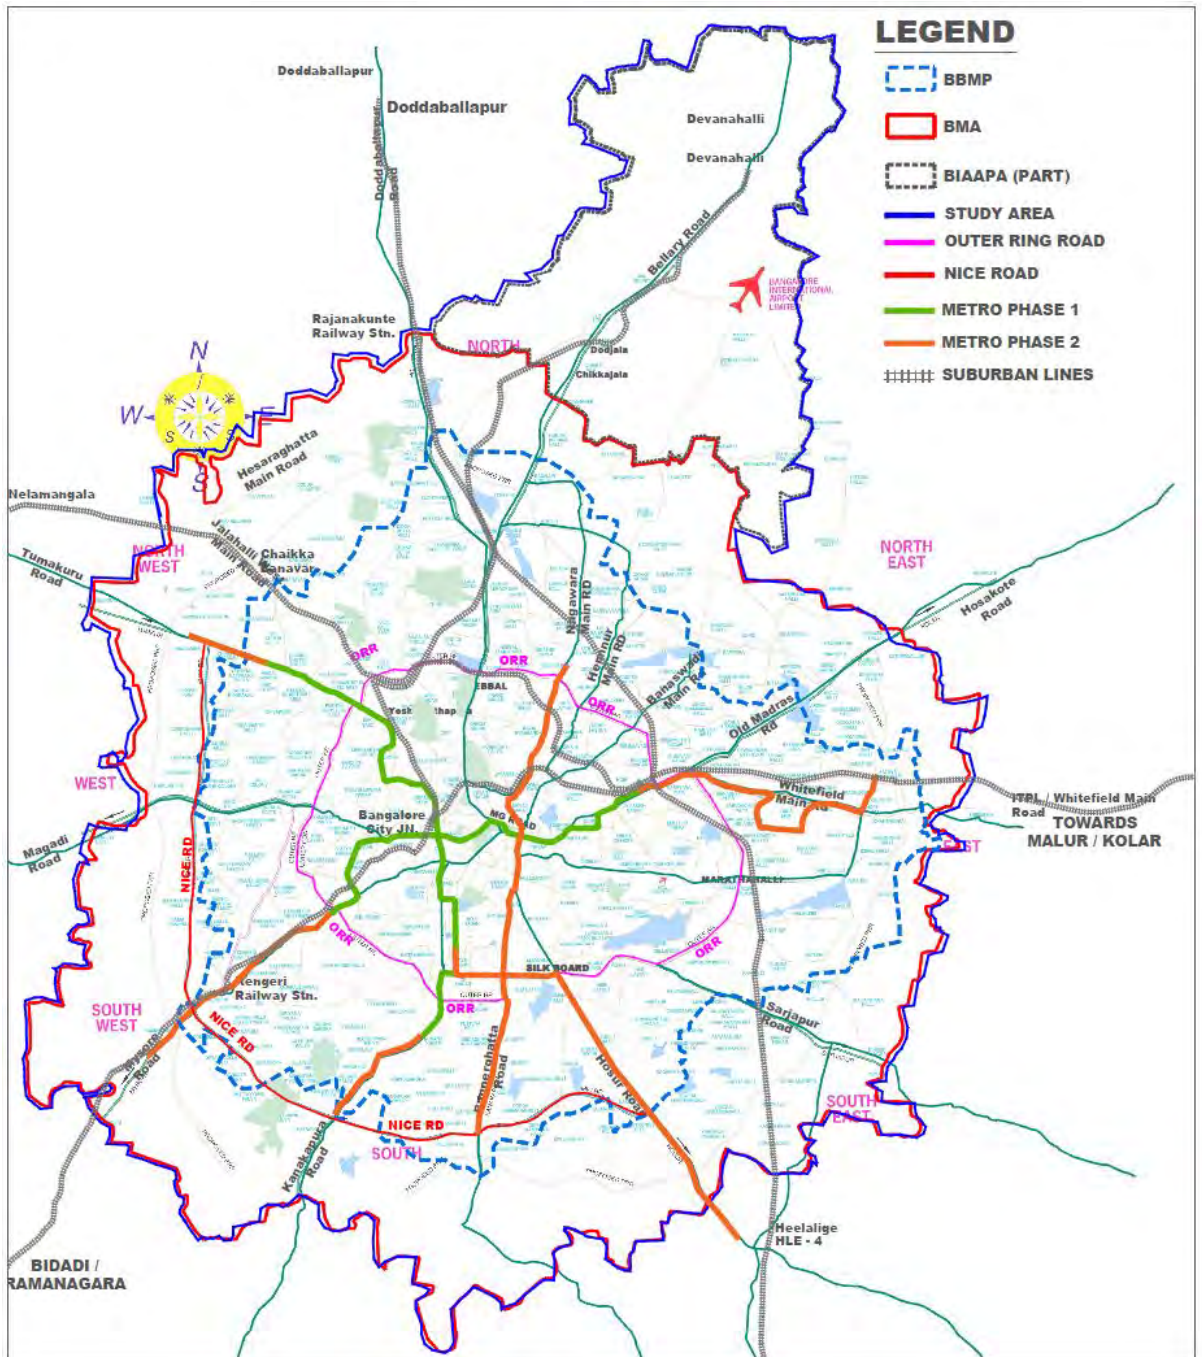

Figure 3-2: Metro Phase-1 and 2 Corridors

The major transport proposals committed include:

- a) **Metro Phase 2** - The phase 2 of Metro will see the network expand by a distance of 72.095 km. This stretch of the project will see the development of 61 metro stations. Out of these proposed 61 stations, 12 stations are to be built underground. The complete stretch of the 72.095 km long network will be divided into an underground stretch of 13.79 km, an elevated stretch of 57.825 km, and 0.48 km will be at grade.
- b) **Peripheral Ring Road**: The BDA proposes that the peripheral ring road be built (78 kilometers) around Bengaluru. This stretch connects Tumkur Road (NH4) and Hosur Road (NH7) on the northern side acting complementary to existing Nice Road (which is on southern side of city).
- c) **Elevated Corridors**: There is a need for augmenting the capacity of arterial roads in the CBD areas, as well as beyond the ORR. While at-grade augmentation is the default option and should be pursued for peripheral areas, limitations of land acquisition in the CBD require consideration of road capacity augmentation through elevated roads. Hence, the Government of Karnataka is planning on further augmentation of urban road capacity through elevated corridors, with particular attention to the equitable allocation of road space, by prioritizing movements of public transport vehicles, pedestrians and bicyclists.
- d) Augmentation of BMTC buses to double the existing fleet: BMTC's bus augmentation plan for the future years to meet the ever increasing demand.

### 3.1.5 Summary of BAU Scenario

The model output indicates that the road network in all major work zones in the city (Whitefield, Peenya and Electronics City), including the city Centre are highly congested and no further growth must be permitted in these areas and immediate efforts to improve the transport network to these areas are needed.

The volume to capacity ratios are seen to be above 1.0 on nearly all the links.

Figure 3-3: V/C Ratio on all the Links (BMA Area) – 2031

Network congestion will also hamper bus operations significantly. It is observed in the model that the frequency will drop by 50% even when the number of buses are doubled (because of congestion). This had an adverse effect on ridership and revenue for the bus company. Congestion will push the bus company out of business. BMTC is heading into a spiral where congestion will reduce the attractiveness of the bus company, which in turn would only serve to favor more private modes which would only increase congestion.

The detailed comparison on travel characteristics between Base Year and Horizon Year is presented in **Table 3-3** under BAU scenario, where, the public transport share would drop down to 36 % from present 48% .

The BAU scenario forecasts indicate an alarming situation in the future years, if no proper action is taken up. It is estimated that Bengaluru losses close to 1550 crore of import cost towards fuel. The travel time and fuel spent have been computed for an Ideal situation (30 Kmph) link wise and compared with the base year modelled values. The net loss due to congestion works out to phenomenal. The total fuel lost due to congestion works out to be 3.8 lakh liters per hour (nearly 50 crore litres per year!). The yearly man hour lost is 60 crores hours resulting in monetary loss of nearly Rupees 4100 crore per year.

The Travel Characteristics for the base year and horizon year under BAU scenario are shown in **Table 3-3**.

**Table 3-3: Comparison on Travel characteristics between Base Year and Horizon**

| Modes            | Base Year (2015) |            | BAU (2031)       |            |
|------------------|------------------|------------|------------------|------------|
|                  | Peak Hour Trips  | Mode Share | Peak Hour Trips  | Mode Share |
| Car+Taxi         | 264,649          | 21%        | 689,673          | 30%        |
| Two Wheeler      | 296,468          | 24%        | 666,685          | 29%        |
| Auto Rickshaw    | 96,655           | 8%         | 114,946          | 5%         |
| Public Transport | 601,861          | 48%        | 827,608          | 36%        |
| <b>Total</b>     | <b>1,259,633</b> |            | <b>2,298,912</b> |            |

| Average Trip length in KM | Base Year (2015) | BAU (2031) |
|---------------------------|------------------|------------|
| Car                       | 10.2             | 16         |
| Two Wheeler               | 9.8              | 16.8       |
| IPT                       | 3.7              | 8.4        |
| Public Transit            | 12.0             | 13.1       |

| Emissions in Tonnes     | Base Year (2015) | BAU (2031) |
|-------------------------|------------------|------------|
| CO <sub>2</sub> Per Day | 29204            | 69062      |
| HC Per Day              | 51               | 126        |
| SPM Per Day             | 9                | 24         |
| NO <sub>x</sub> Per Day | 323              | 768        |
| CO Per Day              | 198              | 464        |

Key observations from the BAU scenario are:

- The Vehicular trips increase by more than 2.5 times
- The bus frequency would reduce to less than half even with the doubling of fleet
- Most links will be operating at V/C ratio greater than 1. The overall network speed (both direction traffic and all regional roads included) drops down to 8kmph. In the peak direction this is less than 5 kmph - A clearly non- sustainable situation.
- The pollution levels from vehicular emission would increase nearly 3 times

### 3.2 Development of Sustainable Urban Transport Scenario

As shown in the earlier section, the BAU scenario results in increased private trips and decreased Public Transport trips. As per the Ministry of Housing and Urban Affairs guidelines, a sustainable scenario has to be considered to reduce congestion and pollution, while conserving resources like urban space and capital expenditure. Hence, a strategic framework has been developed for the CMP vision of "efficient and sustainable transport for all" envisaged in Chapter 1.

#### 3.2.1 Strategic Framework for the Scenarios

Transitioning to pathways of efficient and sustainable urban transportation requires significant, coordinated, and multi-sectoral action. A holistic approach is needed to achieve efficient and sustainable mobility, with multi-sectoral measures that result in avoiding unnecessary motorized trips, shifting a significant proportion of trips to more sustainable modes of transport, and incentivising cleaner and more efficient vehicular technologies to minimize negative externalities while improving accessibility. This requires a wide range of actions at different levels of governance, from promoting more integrated land-use planning and transit-oriented development for reduced travel demand to incentivizing cleaner vehicular technologies through policy and regulation. Shifting travel demand to more sustainable modes also requires a range of push and pull mechanisms that incentivize public transportation and shared mobility, while dis-incentivizing personal transport.

With the rapid growth in urban transport demand in Bengaluru, there is an urgent need to enable environmentally sustainable and economically efficient transport systems that increase accessibility for all urban residents. The traditional approach to dealing with transport demand, with the provision of additional road space to improve vehicular mobility, is no longer sufficient to ensure ease of movement in a sustainable manner. The focus now must be on moving people rather than vehicles, with an integrated and seamless transport system providing modal choice and viable alternatives to personal vehicle use.

The way forward should be to transition away from the current laissez-faire system that subsidises low-occupancy, personal mobility at the cost of public transport efficiency and the quality of the urban environment. The objective is to move towards an efficient and sustainable system that meets mobility needs of all residents of Bengaluru in an equitable manner and complements the growth of the city as the economic engine for the State as well as the Country.

Multiple strategic interventions and specific sets of action are needed to move away from BAU scenario to the vision scenario of "efficient and sustainable transport for all". The strategic framework to achieve that vision has been formulated at macro level to allow flexibility in

delineation of specific action plans, their prioritization, sequencing and implementation in the dynamic urban environment.

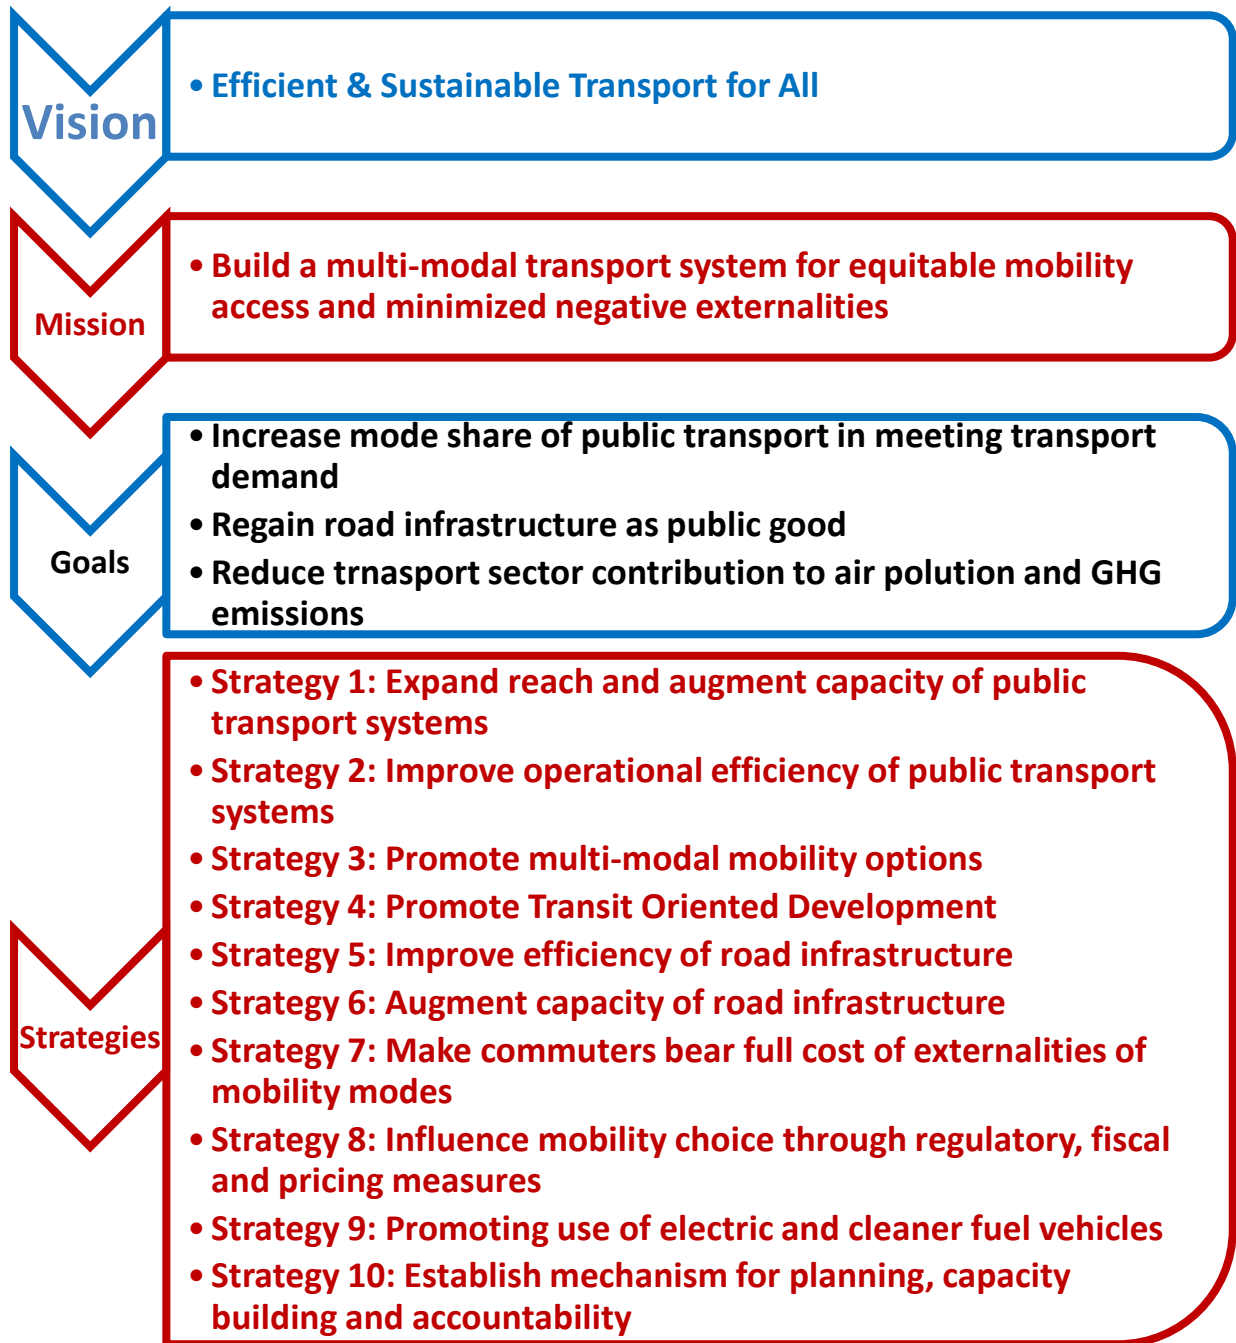

Figure: 3-4: Strategic Framework for Efficient and Sustainable Transport

### 3.2.1.1 Strategy 1: Expand reach and augment capacity of public transport systems

As the city has expanded beyond walkable and cyclable limits, public transport is the most efficient and sustainable mode for supporting equitable urban mobility. While shares of public transport usage was high in Bengaluru, the share has experienced a decline in recent decades due to lowering of speed of busses in view of the congestion caused by private vehicles, and aging and overburdened fleet of busses.

The areas of operations of existing public transport systems, both road-based and rail-based, should be expanded throughout the city to provide convenient mobility options for commuters. At the same time, capacity of existing systems should also be expanded to provide frequent and reliable transit services for commuters during peak and off-peak hours.

### 3.2.1.2 Strategy 2: Improve operational efficiency of public transport systems

While the creation of infrastructure and capacity of public transport is critical, these systems also need to achieve operational efficiency to enhance commuter convenience and to optimize throughput- for instance, the Bengaluru Metro currently has a ridership of 9500 commuters per km per day, whereas it has a potential capacity that is two times this value. Similarly, the BMTC, which has a wide coverage of bus stops and bus routes across the city, can further optimise the frequency of services and on-time performance to provide more reliable services to commuters. Upgradation of the aging bus fleet and driver training for improved safety can further improve performance of the system. Use of the agency's comprehensive ITS system for data-driven decision making and route rationalisation exercises on a periodic basis will ensure viability and operational efficiency.

There should be a continuing and incentive-based focus by transit agencies on improving operational performance, using technology, innovation and partnerships.

### 3.2.1.3 Strategy 3: Promote multi-modal mobility options

As urban mobility in the city has experienced a shift towards greater personal vehicle ownership and usage, it is necessary to arrest this trend and achieve more efficient, sustainable and equitable mobility by building a system that provides multiple options for quality transport. An effective multi-modal transport system that provides integrated, seamless and safe mobility has been found to reduce personal vehicle usage. This requires infrastructure investments that go beyond road networks for vehicles and include investments in public transport, NMT networks, and rail-based infrastructure. Integration between these different modes is essential to increase ease of access and movement, with multi-modal transit hubs and technology-based applications that provide integrated information and payment systems. By promoting urban transport policies centered around multi-modal mobility, it is possible to build mobility systems that are more diverse, equitable and resilient.

### 3.2.1.4 Strategy 4: Promote Transit Oriented Development

A strategic goal of bringing at least 25% area of BMA under Transit-oriented development (TOD) is recommended. The TOD would bring together the closely-related urban planning and transport planning sectors, which are currently governed in silos, for facilitating development, including redevelopment of existing areas, through a mix of residential, commercial and recreational land-uses in dense and walkable layouts that are centered around high-quality

mass transit networks. TOD would promote the use of NMT and public transport trips, while at the same time augmenting ridership of mass transit systems and reducing trips made by private vehicles. Greater integration in the governance of urban planning and urban transport would be needed to promote transit-oriented development and redevelopment in the city.

Other land-use related policies such as mixed land use, job decentralization and urban compaction were analyzed for sustainable goals.

### 3.2.1.5 Strategy 5: Improve efficiency of road infrastructure

A large part of the capacity of the road network in the city is blocked in unproductive and inefficient usage, due to improper planning as well as unregulated behaviours. Parking is a key culprit, taking up 25 to 50 per cent of urban road widths- lack of a comprehensive parking policy and insufficient investments in building public parking capacities have resulted in even the most overburdened roads being used for organised and unorganised parking. Lack of parking provision by commercial establishments and individual vehicle owners has led to unregulated residential and commercial parking taking place on roads not designed for the same.

Other factors impacting the throughput efficiency of urban roads include the design of cross roads and junctions. Cross roads at shorter distances and the signalisation of their junctions with arterial roads are contributing to reduced speeds- for example, Dr. B.R. Ambedkar Road and M.G. Road have 5 signals each over distances of 1.5 km and 2.1 km respectively. Poor junction design with inadequate distribution capacity further aggravates throughput inefficiencies. Yet more factors include the non-uniform capacity of roads, flyover ramps occupying normal traffic lanes, lack of bus bays and the location of bus stops close to road junctions, all of which create bottlenecks in traffic flow leading to congestion.

For efficient road networks that work at full capacity and improve the management of traffic flows, it is necessary to free up road space from unproductive uses and enhance throughput of the road infrastructure.

### 3.2.1.6 Strategy 6: Augment capacity of road infrastructure

In addition to inefficient use of road infrastructure, the overall capacity of the road network is also a major constraint. Fast-growing parts of the city along the urban periphery contribute hugely to the population growth, but depend on inadequate and poorly-planned road networks that were not built for current transport demand levels. Urban growth beyond the Outer Ring Road, developed as a major arterial road with a 4 to 6 lane capacity to avoid traffic through the CBD, has resulted in large stretches of the ORR handling vehicle flows up to 2.5 times the road capacity during peak hours. Some of the busiest traffic junctions in the city are on ORR, namely, Hebbal, K.R.Puram and Central Silk Board junction with daily PCU counts of 3 lakh vehicles. This congestion, in turn, puts additional pressure on arterial roads in the CBD areas.

There is a need for augmenting the capacity of arterial roads in the CBD areas, as well as that of the ORR. Planned road infrastructure in the rapidly developing peripheral areas such as Whitefield are also necessary for more equitable road densities across the city. While at-grade augmentation is the default option and should be pursued for peripheral areas, limitations of land acquisition in the CBD require consideration of road capacity augmentation through elevated roads. While major arterial roads leading out of the city have had their capacities

augmented with the construction of elevated corridors in the past decade (Hosur Road, Bellary Road, Tumkur Road), there has not been much addition to road capacity within the CBD area. All further augmentation of urban road capacity, be it at-grade or along elevated corridors, should pay particular attention to the equitable allocation of road space, and should prioritise movements of public transport vehicles, pedestrians and bicyclists.

### **3.2.1.7 Strategy 7: Make commuters bear full cost of externalities of mobility modes**

There are several negative externalities attributed to low-occupancy transport modes such as personal vehicles and certain IPT modes that contribute to increased vehicle kilometres travelled and fuel consumed. With the current *laissez faire* approach to regulating the usage of inefficient transport modes, the costs of the resulting negative externalities are not borne by the users themselves. Instead, the costs fall disproportionately on commuters that are dependent on walk-based and public transport modes with the encroachment of spaces meant for NMT by parked vehicles and the hampering of movement of public transport vehicles by excess traffic.

The current regulatory and fiscal regime do not account for the costs imposed by inefficient transport modes- for instance, taxi services under the guise of 'shared mobility' enjoy taxes lower than those on public transport and personal vehicles. Based on the principles of fairness and polluter-pays, a new approach is needed which imposes the full costs of negative externalities of given modes on their users in a proportionate manner, to mitigate their impacts on the city and influence more efficient mode choices.

### **3.2.1.8 Strategy 8: Influence mobility choice through regulatory, fiscal and pricing measures**

Mobility is one of the core enablers of economic growth, and the fulfilment of the mobility needs of all urban residents in an efficient, sustainable and equitable manner is vital. Individuals choose to fulfil their mobility needs using a wide variety of transport modes ranging from single-occupancy personal vehicles to high-occupancy public transport services. These mode choices are often shaped by the regulatory and fiscal framework governing the urban transport system, which has traditionally favoured car-based personal transport. However, the goal of mobility systems should be the efficient movement of people and not that of vehicles, and the governance of the urban transport sector needs to evolve to reflect this objective. Regulatory, fiscal and pricing instruments should be designed to restructure the incentives and disincentives that influence commuter mode choices, with efficient and sustainable modes being favoured and prioritised over inefficient ones.

### **3.2.1.9 Strategy 9: Promoting use of electric and cleaner fuel vehicles**

In spite of favourable climatic conditions, air pollution caused by transport vehicles is becoming a major challenge as the incremental pollution load in Bengaluru is assessed to be the third-highest among all major cities in the country. While the case of e-vehicles, when charged by electricity generated from fossil fuel, in mitigating overall greenhouse gas emissions is debatable, those vehicles certainly can help in mitigating air pollution in a big manner in the city. The strategic intervention should be to set-up measures for increasing use of e-vehicles and CNG vehicles and appropriate electricity pricing for charging of e-vehicles at homes through smart meters.

**3.2.1.10 Strategy 10: Establish mechanism for planning, capacity building and accountability**

Fragmentation in the governance of urban transport leads to conflicting objectives, and inequitable distribution of transport investments. The establishment of a single organization at the city level is necessary for integrated planning of mobility infrastructure, coordination among different public agencies responsible for mobility services, capacity building in transit agencies for optimization of mobility services, development of a framework for accountability of those agencies, advisory role to State Government for regulatory functions, and the setting up of infrastructure common to different service providers for greater multi-modal integration. Such an organisation should have a legislative mandate and its scope should be wider than being merely advisory.

**3.2.2 Alternate Strategies for Sustainable Urban Transport**

The business as usual scenario will not work for Bengaluru and it would be imperative for the city to pursue an improved transportation network. The public transport share will drop down severely and even by 2031 where population is expected to double, network congestion will render Bengaluru unlivable. In that context following three strategic scenarios are considered.

**1. Public Transport Augmentation and Efficiency Improvement, and Multi-modal Transport (Strategies 1, 2 and 3)**

This scenario is premised on augmenting reach and capacity of public transport system, mainly from the projects already on the approval or planning stage and taking measures for multi-modal transport options through commuter rail, expansion of metro network along outer ring road and radial roads, and bus fleet augmentation.

The Model was run for this option and the PT Share showed an improvement to 59% . However, the street network continued to show distress as the vehicles would nearly double to what is there today. As a result, first and last mile connectivity would continue to be problematic.

**Table 3-4: Forecast Mbdal Share (Option 1)**

| Mbdes            | BAU (2031)       |            | Option 1         |            |
|------------------|------------------|------------|------------------|------------|
|                  | Peak Hour Trips  | Mbde Share | Peak Hour Trips  | Mbde Share |
| Car+Taxi         | 689,673          | 30%        | 572,638          | 25%        |
| Two Wheeler      | 666,685          | 29%        | 304,780          | 13%        |
| Auto Rickshaw    | 114,946          | 5%         | 71,406           | 3%         |
| Public Transport | 827,608          | 36%        | 1,350,088        | 59%        |
| <b>Total</b>     | <b>2,298,912</b> |            | <b>2,298,912</b> |            |

**2. Public Transport Augmentation plus Enhanced capacity and Efficiency of Road Infrastructure (Strategy 1 to 3, 5 and 6)**

This scenario envisages improving efficiency of existing road infrastructure and augmenting the road capacity through junction improvements and smoothening bottlenecks (strategy 5), at-grade road widening and elevated roads while earmarking a part of the new capacity for

bus-based public transport (strategy 6) besides more ambitious expansion of the public transport (strategy 1 to 3).

In the absence of demand management, scenario 2 though an improvement over scenario 1 will also give sub-optimal results as increased number of private vehicles and longer trip lengths will continue to congest the roads, bus services will be slower, and first and last mile connectivity will remain a challenge. It is estimated that the road network will continue to show low speeds of about 6-7 kmph (on the peak directions) as the scenario does not consider any measure for influencing demand for private vehicles and the additional road capacity will get used up largely by more private vehicles.

**Table 3-5: Forecast Modal Share (Option 2)**

| Modes            | BAU (2031)       |            | Option 2         |            |
|------------------|------------------|------------|------------------|------------|
|                  | Peak Hour Trips  | Mode Share | Peak Hour Trips  | Mode Share |
| Car+Taxi         | 689,673          | 30%        | 532,581          | 23%        |
| Two Wheeler      | 666,685          | 29%        | 261,240          | 11%        |
| Auto Rickshaw    | 114,946          | 5%         | 67,922           | 3%         |
| Public Transport | 827,608          | 36%        | 1,437,168        | 63%        |
| <b>Total</b>     | <b>2,298,912</b> |            | <b>2,298,912</b> |            |

**3.2.3 Comprehensive Mobility Strategy: Transit Oriented Development, Factoring-in full cost of externalities, Regulations on private vehicles, besides Public Transport Augmentation plus Enhanced Capacity and Efficiency of Road Infrastructure, and Cleaner technology vehicles (Strategy 1 to 10)**

This scenario represents the comprehensive approach envisaged through 10 strategies formulated in the previous section. The scenario is premised on all future developments and redevelopments being guided by Transit Oriented Development so that the residents live and work closer to high capacity and efficient public transit corridors reducing the demand for long-distance mobility. By imposing the cost of negative externalities, largely through economic means, on the commuters opting for less efficient transport options, the usage of private vehicles is envisaged to be discouraged significantly and thereby regaining the road infrastructure as public good. While these two measures influence the demand, the supply side is to be taken care by expansion and improve efficiency of public transport systems and methodical efforts for multi-modal integration measures.

The shift in favour of public transport and away from fossil fuel based vehicles to cleaner fuel / technology vehicles is estimated to facilitate reduction in the pollution load.

As per the pollution control emission factors, data from model results show a huge increase of pollutants which will be brought down by the CMP mass transit proposals to nearly half of what is today by 2031. Demand management is assumed to reduce this by another 10%. And a penetration of 20% trips will further reduce pollutants. A study by Indian Institute of Science on “Sustainable Transport Measures for Liveable Bengaluru” have recently estimated that the pollutant levels would have if private vehicles and buses would run on electricity only.

**Table 3-6: Forecast Modal Share (Option 3)**

| Modes            | BAU (2031)       |            | Option 3         |            |
|------------------|------------------|------------|------------------|------------|
|                  | Peak Hour Trips  | Mbde Share | Peak Hour Trips  | Mbde Share |
| Car+Taxi         | 689,673          | 30%        | 394,472          | 17%        |
| Two Wheeler      | 666,685          | 29%        | 181,126          | 8%         |
| Auto Rickshaw    | 114,946          | 5%         | 42,669           | 2%         |
| Public Transport | 827,608          | 36%        | 1,680,644        | 73%        |
| <b>Total</b>     | <b>2,298,912</b> |            | <b>2,298,912</b> |            |

**Table 3-7: Comparison of Emissions (in Tonnes)**

| Emissions in Tonnes     | Base Year (2015) | BAU (2031) | Option 3 |                   |       |                                       |
|-------------------------|------------------|------------|----------|-------------------|-------|---------------------------------------|
|                         |                  |            | Option 2 | Demand Management | NMT   | All Buses and Cars Run on Electricity |
| CO <sub>2</sub> Per Day | 29204            | 69062      | 17880    | 16092             | 12874 | 6437                                  |
| HC Per Day              | 51               | 126        | 28       | 25                | 20    | 10                                    |
| SPM Per Day             | 9                | 24         | 7        | 6                 | 5     | 3                                     |
| NO <sub>x</sub> Per Day | 323              | 768        | 173      | 156               | 125   | 62                                    |
| CO Per Day              | 198              | 464        | 120      | 108               | 86    | 43                                    |

### 3.3 Analysis and Indicators

This section describes the computation process for the indicators. The specific parameter and the Level of Service has been discussed and presented in Chapter-4.

Summary table of LoS calculated for study area (Overall LoS) is presented in **Table 3-8**

**Table 3-8: Service Level Benchmarking Summary**

|  | Existing LoS | Option 3 LoS | Remarks   |
|--|--------------|--------------|---|
| <b>Public Transport Facilities</b>                                     | 2            | 1            | The city has Public Transport system which may need considerable improvements in terms of supply of buses/coaches and coverage as many parts of the city are not served by it. The frequency of the services may need improvements                                |
| <b>Non Motorised Transport (NMT) facilities</b>                        | 4            | 2            | The city lacks adequate NMT facilities  |
| <b>Travel speed (Motorized and Mass Transit) along major corridors</b> | 4            | 2            | Significant approach delays and average travel speed of 1/3 the free flow speed or lower. Such conditions causing a combination of one or more reasons such as high signal density, extensive queuing at critical intersections and inappropriate signal timing.. |
| <b>Parking spaces</b>  | 4            | 3            | Paid parking spaces provided in the city need to be improved upon and to cater to the demand some differential parking rates for the CBD have been adopted. The city authorities need to imitative considerable improvements measures.                            |
| <b>Road Safety</b>   | 3            | 1            | Level of Fatality rate in a city is very low.   |
| <b>Pollution levels</b>  | 2            | 1            | Level of pollution in a city is very low.   |

**Note:** This is based only on procedure provided in Indices as per the guidelines.

### 3.4 Conclusions

The Comprehensive Scenario 3 comprising of 10 Strategic interventions is recommended for optimal, efficient and sustainable transport system for the city.

The strategy for solving the complex and serious traffic issues of Bengaluru will be aimed at improving Public transport by the provision of Metros, BRTs (elevated if necessary), and Commuter lines.

Network augmentation will have to be also resorted to, to ensure that Bus Augmentation will have road space on which it has to run efficiently.

The analysis shows that if the CMP proposals are implemented, the road network would be able to operate at a level of service C and the environmental pollution would drop to half of what is it today.

Pursuing alternate technologies to ensure that harmful gases are further removed can reduce pollution levels to only 20% of what is today.

The implementation of these development strategies will result in improved mobility. The Mode Share predicted is a theoretical analysis of capacities and routes. This will be achieved only through demand management measures or making private mode use less attractive.

The pressure on the public transport network in the central area will experience heavy volumes of traffic in either direction in the peak hour. Spill over from this may badly clog the network. Capacity augmentation of the central links will have to be pursued to meet this huge demand.

## 4 Development of Comprehensive Mobility Plan

The current mobility eco-system and its trends being unsustainable from economic as well as environmental perspectives, the strategies recommended in the previous chapter to address the root causes of the unsustainability will require a comprehensive set of actions taken in tandem in a time bound manner. This chapter delineates the necessary actions at the conceptual level which may be used to identify ground level improvement and capacity addition works and to formulate the regulatory, fiscal and economic interventions. Initial lists of candidate projects for each strategy have also been proposed.

The comprehensive mobility plan covering first nine strategies recommended as part of Scenario 3 in the previous chapter has been arranged in following twelve themes.

1. Integrated Land Use and Mobility Plan
2. Public Transport Improvement Plan
3. Road Network Development Plan
4. Non-Motorized Transport Plan
5. Multi-Modal Mobility Plan
6. Private Transport Management Plan
7. Freight Movement Plan
8. Technological Measures
9. Travel Demand Management Plan
10. Regulatory Measures
11. Governance Measures
12. Fiscal Measures

The tenth strategy of “establishing the mechanism for planning, capacity building and accountability” is covered in the next chapter in the section related to institutional framework.

### 4.1 Integrated Land use and Mobility Plan

#### 4.1.1 Revised Master Plan 2031

The integration between the land use plan and the mobility plan is expected to be provided by the Transit Oriented Development (TOD) Policy. The Revised Master Plan 2031 (Draft) (herein after referred as RMP 2031) was formulated without the benefit of the Comprehensive Mobility Plan (CMP) and the TOD policy. The RMP 2031 envisages vision of “a liveable and well governed Bengaluru premised on efficient mobility and vibrant ecology”. The transport strategy of the RMP included pre-eminence of public transport and non-motorized transport with share of public transport being 50% in all trips and 70% in motorized trips, demand management, land-use and transport integration, 20-25% of planning area being under TOD, and interstate bus and rail hubs.

The RMP 2031 has categorized the BMA in three areas, namely, Planning Area A comprising of the innermost core area falling within Outer Ring Road (ORR), Planning Area B comprising of area between ORR and Conurbation limit of RMP-2015, and Planning Area C comprising of the outermost zone from conurbation limits till BMA boundary. Three growth scenarios were developed for the BMA, namely, Containment Strategy, Corridor Driven Growth Strategy which is TOD led development, Differential Strategy. Finally based on the evaluation, The RMP 2031 seeks to adopt Differential Strategy. The Confinement Strategy was not found suitable to accommodate the projected population. Between the two other strategies, the Differential Strategy has been preferred in the RMP 2031 over the TOD led Corridor Driven Growth Strategy. The Differential Strategy aims to minimise commercialisation in the Planning Area A (city core) and promote economic activities along the periphery of the BMA so that need to travel to core city can be avoided. In spite of the stated goal of promoting TOD, the RMP 2031 seeks to discard Corridor Driven Strategy on the ground of population density and traffic congestion in the Planning Area A being high and infrastructure being inadequate to support higher population density and more traffic.

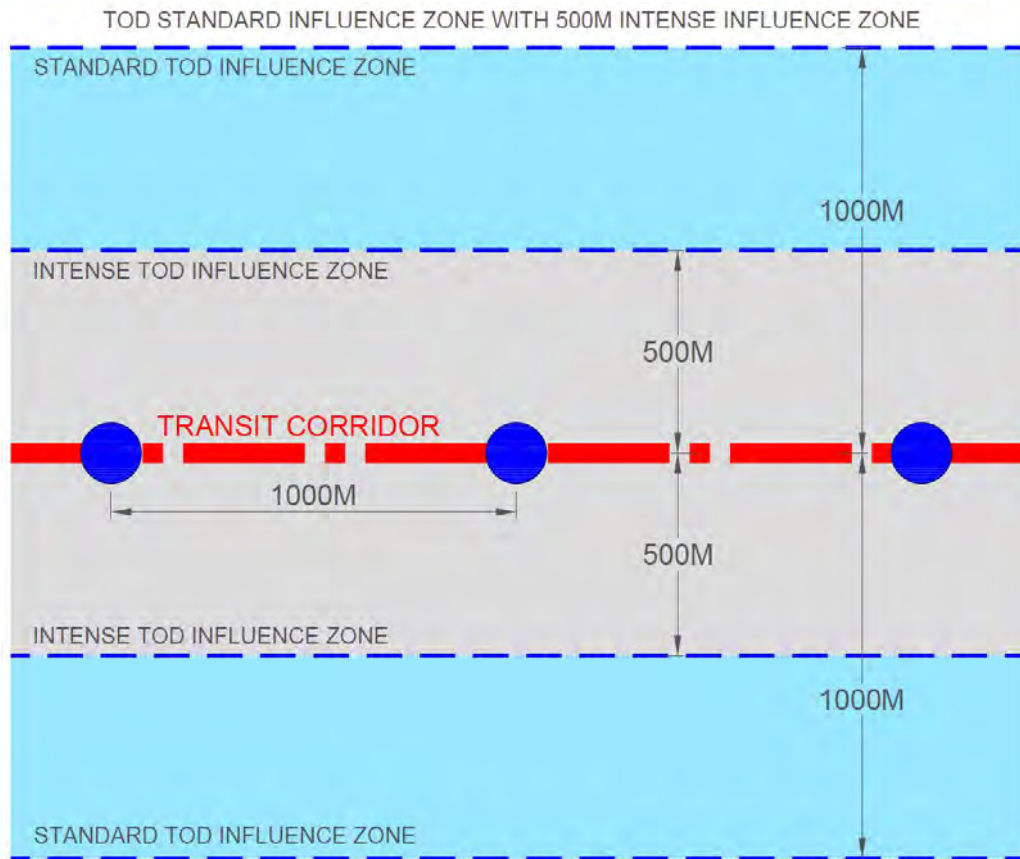

In absence of the benefit of the TOD policy and the CMP, the land use strategy proposed in the RMP 2031 does not support the intent of TOD and instead seems to encourage urban sprawl without noticing that provision of infrastructure over larger areas at the city periphery away from the transit corridors is going to be more difficult and cost-ineffective.

#### 4.1.2 Transit Oriented Development Policy 2019

Since the formulation of the RMP 2031, a draft TOD policy has been prepared and placed in the public domain for suggestions. That policy is being finalized on consideration of the suggestions received. There is a need to recalibrate the RMP 2031 in the light of the TOD policy and the CMP to ensure integration of the land use strategy and mobility strategy in a harmonious manner.

The policy envisages the vision of “Bengaluru becoming a public transport oriented city that is compact, people friendly, environment friendly and support economic growth while offering a good quality of life. The goals of the policy are aligned to that of the CMP with the major goals being achievement of 70% share of public transport in motorized trips and 60% of the city population living within intense TOD zone. The policy assesses that the goals may require about 600 km of mass transit corridors and development of adequate infrastructure so as to achieve the gross density ranging from 250 to 400 PPH (persons per hectare) along the mass transit corridors by 2031. The major components of TOD framework are density, diversity, design, destination accessibility, distance to transit and demand management. The Executive Summary of the TOD Policy 2019 (Draft) for the city is placed at **Annexure 4.1**. The proposed TOD led land use is depicted in the **Figure 4-1**.

The implementation of TOD would include development of capacity of cross road network, NMT, water supply, sewerage and electricity. The cost per km for implementation of TOD would be Rs. 100 Cr.

**Figure 4-1: Transit Oriented Development**

**4.1.3 Recalibration of the RMP 2031**

For facilitating optimum integration of land use and mobility strategies, a recalibration of the RMP 2031 is suggested on following counts.

**4.1.3.1 Development Strategy**

- i. Adoption of Corridor Driven Growth Strategy” instead of “differential strategy”.
- ii. Provision of specific incentivization measures for TOD zone of 2km wide corridor on either side of mass transit corridors.
- iii. Adoption of TOD led redevelopment and urban renewal strategy for Planning Area A
- iv. Facilitation for consolidation of plots in hassle-free manner.
- v. Review of setback and height regulation norms.

**4.1.3.2 Calibrated densification approach**

- i. Assessment of capacities of each planning district for densification or opening up for new development.
- ii. Densification or new development only when the pre-requisites for infrastructure including mobility infrastructure are in place. Investment at Rs. 100 crores per km. of rail based public transport has been suggested in the action plan to augment the infrastructure for the TOD.

**4.1.3.3 Mobility Infrastructure**

- i. Incorporation of specific strategy for augmenting road infrastructure and increasing efficiency of existing road infrastructure in core area and in areas which have seen the deficit with reference to RMP 2015.
- ii. Demarcation of core road network and public utility network on land use plans and prohibition on any diversion of those earmarked lands.
- iii. Earmarking of complementary grid road networks on the land use plans.
- iv. Facilitation development of mobility infrastructure through use of town planning schemes.

**4.1.3.4 Sustainability Regulations**

- i. Imposition of less onerous restrictions on infrastructure projects around/near water bodies.
- ii. Revisiting concept of heritage building/zone and associated development regulations.

**4.1.3.5 Equitable Development**

- i. Provision for EWS housing / plots as part of each new development instead of seeking 2.5% land to be surrendered to the Planning Authority.

**4.2 Public Transport Improvement Plan**

For achieving the CMP goal of 70% of all motorized trips to be met by Public Transport, proper selection of the PT mode, planning, efficient utilization of the PT infrastructure, and inter-modal connectivity are essential. The rail based mass transit systems are more efficient modes of public transport, but have heavy dependency on other modes for first and last mile connectivity.

The CMP envisages 700 km of public transport network within BMA on dedicated rails, roads, road lanes, traction-guidance, i.e., metro, suburban rail, priority bus corridors, BRTS or Metrolite in addition to augmentation of public bus transport services.

As the public transport modes lead to monopoly situation locking up public infrastructure and investments, the selection of the appropriate mode should be guided by objective and robust assessment of the likely ridership. According to the “Reference Guide, Volume 2: Public Transport”, Ministry of Housing and Urban Affairs (MoHUA), following capacity ranges (expressed as ‘passengers per hour per direction’ – PPHPD) are for the selection of public transport modes:

**Table 4-1: Mass Transit System Capacities**

| Transit Mode            | Capacity Range (PPHPD) |
|-------------------------|------------------------|
| Bus Rapid Transit (BRT) | 8,000                  |
| Metrolite               | 15000                  |
| Monorail                | 15,000                 |
| Metro                   | 40,000                 |
| Heavy Metro             | 60,000                 |

#### 4.2.1 Rail-based Public Transport

The rail-based public transport system is the most efficient mode in terms of usage of road space and sustainable from environmental perspective, but requires high cost and is dependent on last mile connectivity by NMT or motorized transport.

##### 4.2.1.1 Metro Rail Services

##### 4.2.1.1.1 Planning and Implementation

The metro rail network is a mega-infrastructure project which has the potential to reshape the city and its mobility patterns, and to contribute to cleaner urban transport. The CMP envisages setting up 300 km metro network by 2031, as shown in **Figure 4-2** and listed in **Table 4-2**.

**Table 4-2: Metro Rail Projects 2031**

| Sl. No. | Metro Corridor   | Length (km)   |
|---------|--|---------------|
| 1.      | Phase 1 (Operational) <ul style="list-style-type: none"> <li>• EW Line 24 km</li> <li>• NS Line 18 km</li> </ul>   | 42            |
| 2.      | Phase 2 (Under construction) <ul style="list-style-type: none"> <li>• EW Line Extensions 22 km</li> <li>• NS Line Extensions 10 km</li> <li>• Electronic City Line 19 km</li> <li>• IIMB Line 21 km</li> </ul> | 72            |
| 3.      | ORR-Airport Line   | 58            |
| 4.      | ORR West Line  | 30            |
| 5.      | Magadi Road (Metrolite - Elevated)   | 13            |
| 6.      | Whitefield – Domlur Line (Metrolite (Elevated) / MRT)  | 16            |
| 7.      | Katamanallur Gate – Sarjapura Road –Hebbal (Metrolite (Elevated) / MRT)  | 52            |
| 8.      | Inner Ring Metro (UG)  | 34            |
|         | <b>Total</b>   | <b>317 km</b> |

Metrolite (Elevated) is suggested as the rail based public transport system for serial nos. 5, 6 and 7 in Table 4-2 above to have a cost effective mobility solution for the likely ridership. The inner ring metro (sl. No. 8) is suggested as the underground system as elevated system is not feasible due to smaller road width. However, this project is premised on Transit Oriented Development becoming the mainstay of urban planning and development in the city.

Figure 4-2: Metro Rail Network 2031

Planning for the metro rail network needs to consider the requirements of future growth, while its construction needs to be optimized for more efficient implementation. with following measures.

- i. Plan new metro lines aligned with the master plan of the city and its areas of growth, keeping in mind the development of economic centres and residential layouts; focus must also be ensured on core areas, where construction may be difficult.
- ii. Integrate planning for metro rail with existing transport networks, through physical integration of metro stations with adjacent railway stations and bus terminals.

- iii. Support robust transit-oriented development (TOD) policy and value capture mechanisms for part-financing metro rail projects and lowering fiscal burden on the transit agency.
- iv. Fast-track the completion of the Outer Ring Road (ORR) line and the metro lines along main arterial roads.
- v. Explore the potential for metro cum road infrastructure, for more efficient and cost-effective infrastructure development.
- vi. Enable improved coordination between government agencies to remove roadblocks in land acquisition and construction and to speed up the pace of metro rail implementation and expansion.

#### 4.2.1.1.2 Measures for improving ridership

Metro operations should aim to minimize end-to-end trip times and maximise ridership, with improved connectivity to station catchment areas.

- i. Improve operational and fare integration with public bus services for last mile connectivity and an end-to-end public transport network.
- ii. Explore the introduction of monthly subscriptions, 10-ticket sets and other products for discounted fares for regular metro commuters.
- iii. Improve access to metro stations through elevated walkways to key economic centers up to one kilometer away, nearby, facilitate the development of NMT infrastructure such as continuous pedestrian footpaths and bicycle lanes within a one-kilometer catchment zone.
- iv. Create transit hubs at metro stations by physical integration of bus stops, IPT bays and bicycle parking, as well as the provision of electric charging infrastructure and parking for shared mobility services.
- v. Minimize transfer times and improve throughput of station areas with real-time passenger information systems, crowd management mechanisms and easy access to last-mile modes, with a prioritization of sustainable modes- bus stops to be closer to station exits than access to parking, for example. Promote shared mobility services for offering additional improvements in connectivity to commuters, through service level agreements with operators.

#### 4.2.1.2 Suburban Rail Services

Bengaluru currently has nominal suburban rail services, which can be augmented significantly by leveraging and supplementing the existing railway tracks by setting up new dedicated tracks within the city, either at grade or at elevation, and supplementing the capacity of existing railway tracks outside the city to suburban towns by automatic signaling and telecommunication, making it a cost-effective option for mass transit. The well-planned suburban rail network integrated with metro network and bus based public transport for multi-modal mobility has the potential to provide affordable and reliable mass transit services that greatly improve ease of connectivity within the city and from the suburban towns. Following specific measures are suggested to enhance ridership and effectiveness.

- i. Fast-track works of enhancing network capacity along the suburban rail route and at stations with track doubling, electrification and automatic signaling works.
- ii. Connect to nearby urban areas such as Bidadi, Ramanagar, Tumkur, Hosur, Bangarpet, Doddaballapur, Devanahalli, etc. for easing long-distance daily commutes.
- iii. Improve access road connectivity to suburban rail stations, to ensure smooth traffic flows to and from the stations.
- iv. Ensure integration with metro rail stations and inter-city rail lines and promote high-quality first and last-mile connectivity to suburban rail stations.

Following 4 corridors within the city on dedicated tracks and their extension to suburban areas through tracks shared with the railways are suggested as part of this CMP. Within the core part of rail network in the city having very high level of utilization of existing tracks for inter-city movement, dedicated sub urban rail tracks have been proposed. However, as the network extends outwards with low utilization of existing inter-city rail tracks, possibility of use of shared tracks by suburban rail and inter-city rail should be explored to optimize the cost.

**Table 4-3: Suburban Rail Projects 2031**

| Sl. No. | Suburban Corridor                             | Length (km) | Proposed System |
|---------|---|-------------|-----------------|
| 1       | Heelalige – Yelahanka – Rajanukunte           | 46          | Dedicated Track |
| 2       | Chikka Banavara – Mattikere - Baiyyapanahalli | 25          | Dedicated Track |
| 3       | KSR Bengaluru – Yelahanka – Devanahalli       | 42          | Dedicated Track |
| 4       | Kengeri – KSR Bengaluru – Whitefield          | 36          | Dedicated Track |
|         | <b>SHARED TRACK (WITHIN STUDY AREA)</b>       |             |                 |
| 5       | Kengeri – Bidadi/ Ramanagar                   | 9           | Shared Track    |
| 6       | Chikka Banavar – Nelamangala (Direction)      | 6           | Shared Track    |
| 7       | Chikka Banavar – Tumkur (Direction)           | 7           | Shared Track    |
| 8       | Whitefield – Malur / Kolar                    | 4           | Shared Track    |
| 9       | Rajankunte – Doddaballpur                     | 2           | Shared Track    |
|         | <b>SHARED TRACK (OUTSIDE STUDY AREA)</b>      |             |                 |
| 10      | Kengeri – Bidadi/ Ramanagar                   | 23          | Shared Track    |
| 11      | Chikka Banavar – Nelamangala                  | 7           | Shared Track    |
| 12      | Chikka Banavar – Tumkur                       | 45          | Shared Track    |
| 13      | Whitefield – Malur / Kolar                    | 51          | Shared Track    |
| 14      | Rajankunte – Doddaballpur                     | 11          | Shared Track    |
|         | <b>Total</b>                                  | <b>314</b>  |                 |

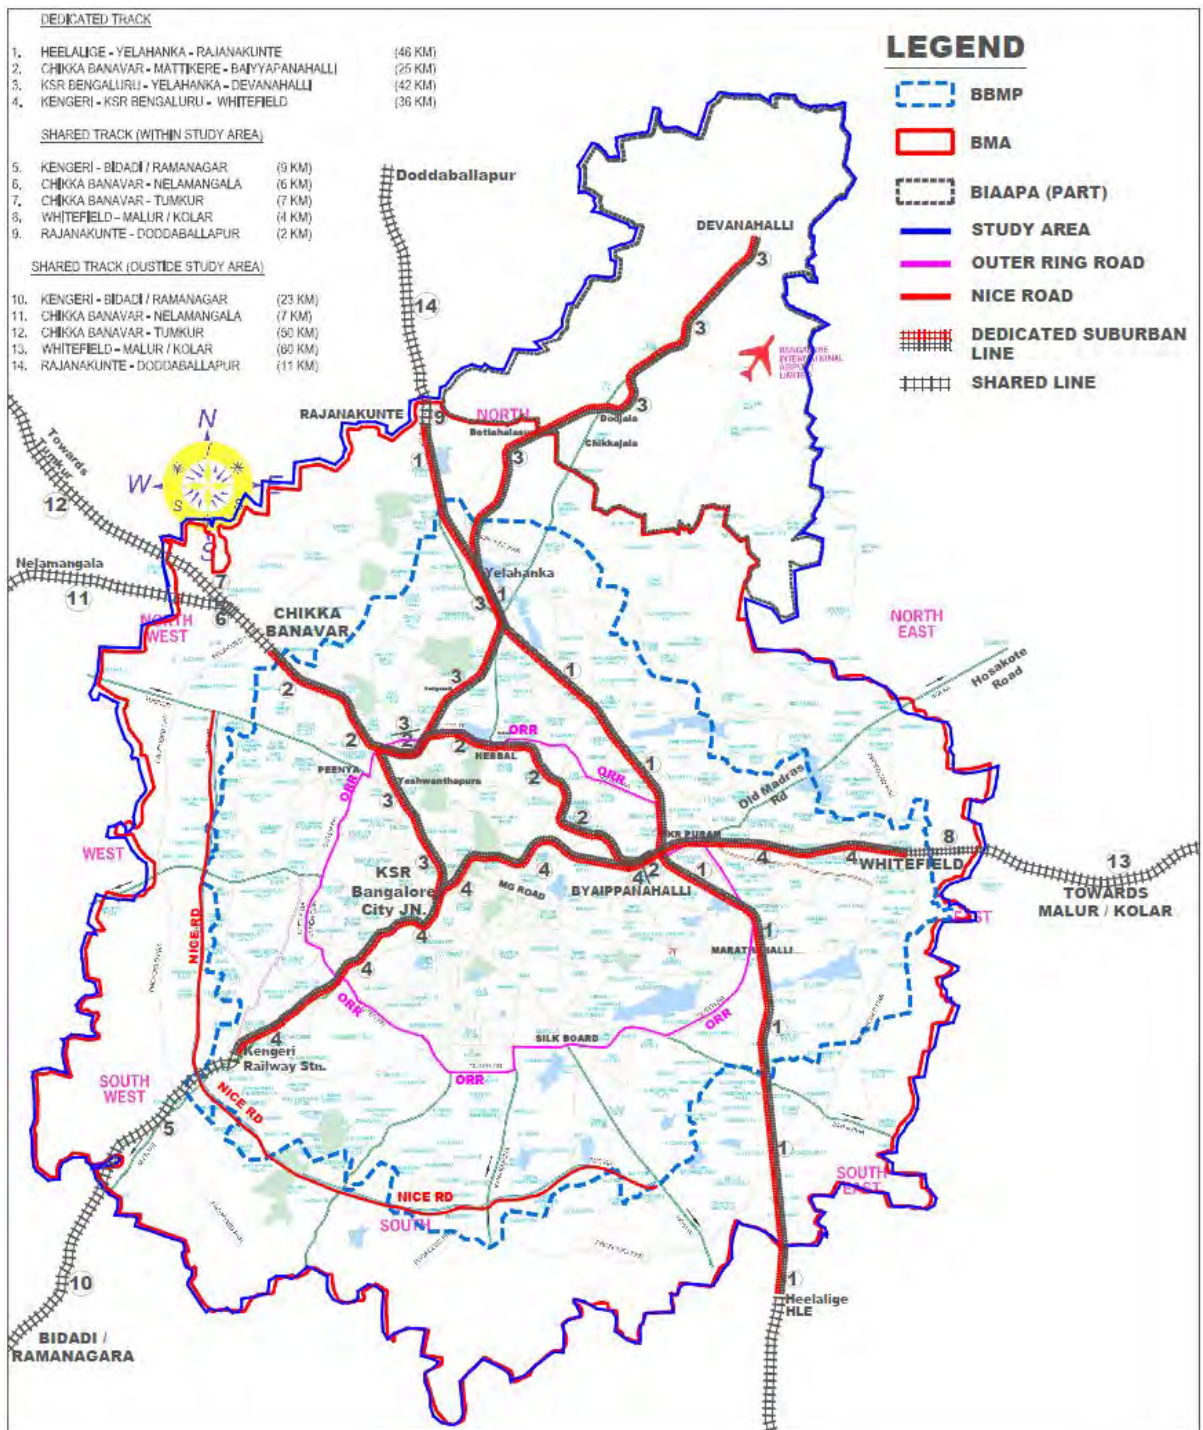

Figure 4-3: Suburban Rail Network 2031

#### 4.2.2 Road based Public Transport

Buses continue to form the spine of public transport systems in Bengaluru, and their low infrastructure requirements makes them a flexible and inexpensive option for expanding transit networks in the fast-growing city. They are also an efficient form of road transport, taking up the least amount of road space per passenger kilometer covered.

However, reduced service quality and reliability of bus services due to road congestion leading to average speed less than 10 kmph during peak hours, limited fleet expansion and operational inefficiencies lead to shift away from public transport and contribute to greater traffic congestion.

Greater investments in the city bus network and improved operational efficiencies can incentivize higher mode shares of public transport and ease congestion. Measures are needed to ensure that the capacity and the reach of the operational fleet is adequate to meet the growing travel demand, and this may be done through fleet augmentation and network expansion.

- i. Provide priority lanes for public transport busses.
- ii. Provide fiscal support or gap funding to BMTC for fleet size augmentation that is commensurate to the growth in population.
- iii. Promote zero emission clean-tech vehicular fleet for lower operational costs and social and environmental benefits, and explore cost-effective procurement methods such as leasing contracts and retrofit mechanisms.
- iv. Expand bus services to all satellite bus stands for better rural-urban connectivity, and increase capacity of network along the peripheries of the BBMP area.
- v. Improved operational efficiency of the public transport network may be achieved through a mix of data-driven and technological improvements to provide higher quality of services to commuters.
- vi. Analyse O-D data, occupancy data and other data points provided by ITS infrastructure for periodic route rationalization of the bus network, to improve deployment of network capacity to match demand.
- vii. Promote private sector contracting through competitive tendering on routes with heavy losses for lowering operational costs while continuing to provide services for all parts of the city.
- viii. Introduce smaller-sized vehicles with capacity of 10 to 20 seats to provide feeder services in interior areas, to improve access to main bus routes and to metro rail services as well as to lower operational costs along low-demand routes.
- ix. Support the phase-out of all BS-II and BS-III vehicles in the BMTC fleet, and subject all new fleet procurements to the highest vehicle emission standards. This may also include the adoption of cleaner fuel and electric fleet augmentation.
- x. Introduce automated fare collection (AFC) mechanisms along feeder routes and loss-making routes to reduce leakage and to lower operating costs by not requiring the conductor for fare collection; actively supplement the introduction of AFC systems with retraining programs for conductors so that they may be absorbed in the transit agency for other operational requirements over the longer term.
- xi. Enable operational integration of bus services with metro services, with bus stops at metro stations and feeder services routed to supplement the last-mile connectivity for the metro network.

- xii. Promote expansion of chartered services whereby BMTC can provide dedicated transport services to IT companies, garment companies and other trip generation centers, thereby reducing dependence on private transport.
- xiii. Operationalize the common mobility card for widespread adoption, for integration of fares across all public transit services.
- xiv. Use ITS data to support an improved and integrated Commuter Information System which can be accessed at all bus stops, bus terminals and via mobile application, with information on routes, stops and schedules, and real-time updates on bus arrival times and service frequency.
- xv. Provide access to operations data to become part of City Mobility Stack, which aims to integrate all mobility services into a seamless urban transport network.
- xvi. Public Transport should be prioritized over private modes. Especially in areas such as Road infrastructure, parking, traffic flow directions, restriction of turning movements, etc.
- xvii. Provision of smart bus shelters and bus bays are per the IRC 80: 1981 specifications designed based on the number of footfalls which are universally accessible at every 500-1000 m
- xviii. Develop supporting access infrastructure facilities to ensure safe access to buses through provision of universally accessible walkways, scientifically designed bus terminals and bus shelters, etc.

### 4.2.2.1 Priority Corridors for public bus services

Adopting strategic measures such as dedicated bus lanes and bus priority corridors with exclusive lanes for public transport busses would improve the average bus speed from current 10 to 15 kmph to 20 to 25 kmph. In this regard, the following 11 corridors have been identified for the implementation and operations of Bus priority lanes.

**Figure 4-4: Bus Priority Corridors**

Exclusive lanes should be earmarked for public transport busses with physical separation based on the available right-of-way (RoW) of 24 meter (6 lanes) or more on these corridors. Strict enforcement measures (preferably by adopting cameras or other automated technology) against violation by private modes must be undertaken.

**Table 4-4: Bus Priority Corridors**

| Sl. No.  | Corridor Name   | Length (Km) |
|--|---|-------------|
| <b>CATEGORY 1: Corridors with Existing ROW ≥24 meter</b> |   |             |
| 1  | Outer Ring Road (Silk Board – Hebbal)   | 30          |
| 2  | Outer Ring Road (Nayanda Halli - JD Marra)  | 11          |
| 3  | Sarjapur Road (Iblur junction - Sarjapura)  | 19          |
| 4  | Hennur Road (Cantonment Road - Hennur)  | 8           |
| 5  | Hebbala Road (Majestic (KBS) - Hebbala)   | 13          |
| 5A   | Jayamahal Road Cantonment Junction to Mekhri Circle   | 5           |
| 6  | Inner Ring Road (SwamyVivekanada Metro Station to Central Silk Board)   | 10          |
| 7  | Yeshwantpur-Electronic City via Kengeri (Along outer ring road, old outer ring road, 100 Ft road and NICE road) | 53          |
| <b>Category 2: Corridors to be widened</b>               |   |             |
| 8  | Hosur Road (Majestic (KBS) to Central Silk Board)   | 12          |
| 9  | Old Airport Road (Majestic (KBS) to Kadugodi)   | 27          |
| 10   | Magadi Road (Majestic (KBS) to Gollarahatti)  | 14          |
| <b>Total</b>   |   | <b>202</b>  |

In medium term to long term, once metro is established on some of these corridors for example ORR (Sl. No. 1 and 2), Sarjapur Road (Sl. No. 3) etc., exclusive bus lanes on these roads will not be necessary. The focus on those corridors should be on establishing feeder bus services.

**4.2.2.2 Bus Fleet Augmentation**

As part of the public transport strategy, augmenting the existing city bus services should be considered. The BMTC, at present is operating 6634 buses on about 2500 routes with 10 TTMCs (Traffic and Transit Management Centers) and 45 depots. The bus fleet size should be expanded to 16582 by 2031. 40 new depots and TTMC/ Bus Terminals have been identified within the newly planned areas of BMA. Besides, BMTC should rationalize its routes from time to time in line with the progress in development of mass transit network (metro/sub-urban rail network) to reorient its services towards improving the overall public transport accessibility including first and last mile connectivity and more focus on areas unserved by rail based public transport, in the city. In order to compliment services of the mass transit system, BMTC would also operate smaller feeder services (10-20 seater capacity) which would be conductor free and operating a shorter trip length of 5-8 Km radius.

**Table 4.5: Bus Fleet Requirement**

| Year | Number of Buses (Augmentation + Replacement) | Total Fleet Strength | Type of Buses   | No. of Depot Requirement for BMTC |
|------|--|----------------------|---|-----------------------------------|
| 2019 |  | 6634                 | <ul style="list-style-type: none"> <li>• <b>Standard Buses</b> <ul style="list-style-type: none"> <li>- 12 m and 9 m buses</li> <li>- Electric / Diesel</li> <li>- Semi Low Floor / Low Floor</li> <li>- AC / Non-AC</li> </ul> </li> <li>• <b>Smaller Capacity Buses</b> (10 to 20 seater buses) for first and last mile connectivity.</li> <li>• <b>Electric Trolley Bus</b></li> </ul> |                                   |
| 2021 | 4250   | 10609                |   |                                   |
| 2025 | 10600  | 13000                |   | 40                                |
| 2031 | 16225  | 16582                |   | 30                                |

**4.2.2.3 Bus Rapid Transport System or Metrolite**

BRTS or Metrolite (traction guided at-grade public transport system) is suggested for Peripheral Ring Road (PRR) and NICE Road. The selection between BRTS or Metrolite will need to be done based on detailed ridership assessment and alternate analysis. The total length of BRTS / Metrolite on NICE road and proposed PRR is 107 km.

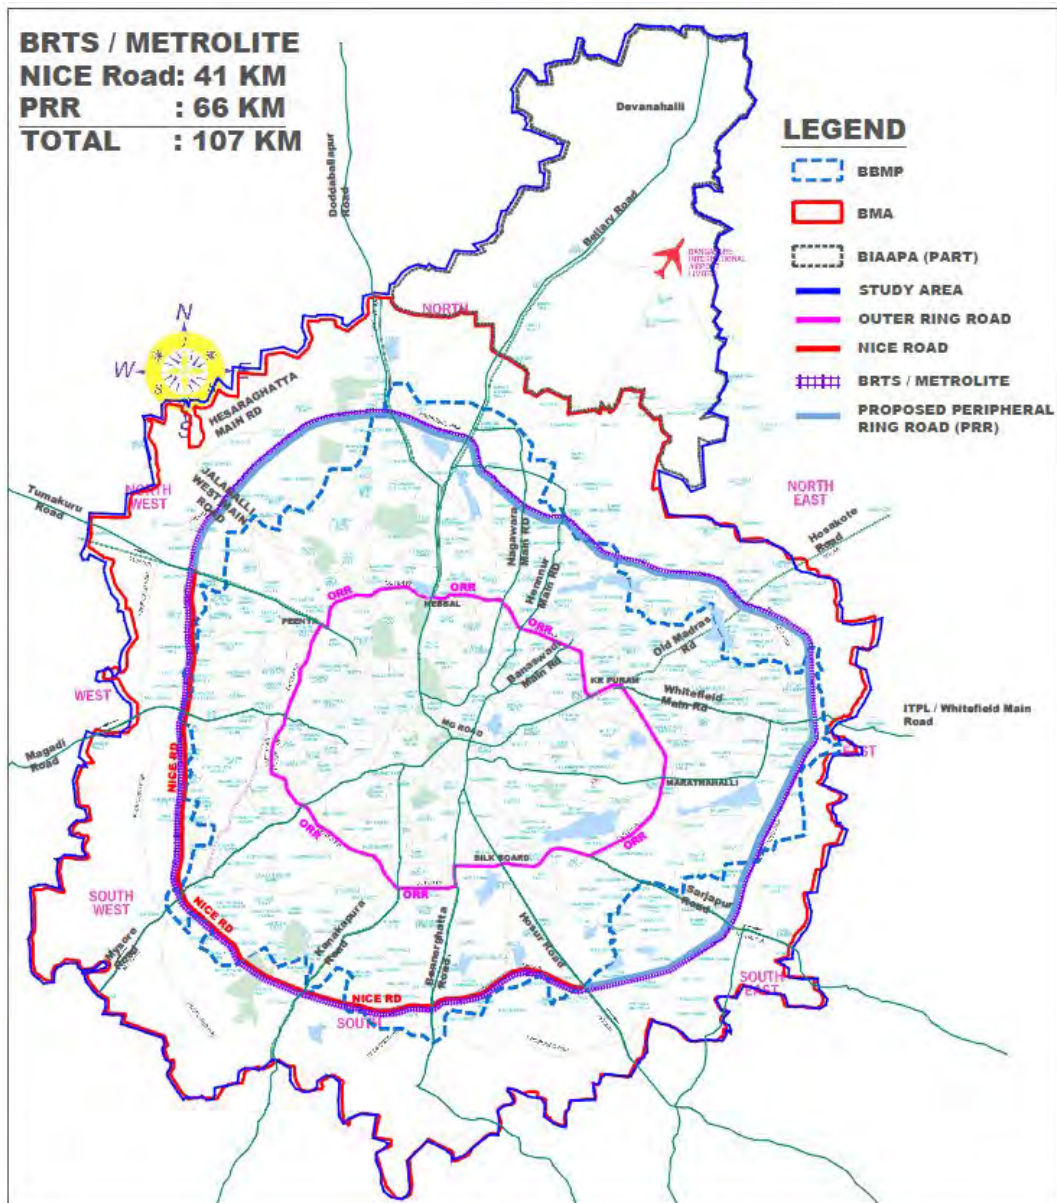

Figure 4-5: BRTS / Metrolite Network

#### 4.2.3 Overall Public Transport Network 2031

The overall public transport network of 803 km length within BMA is envisaged to be established under different modes, as detailed in previous sections on dedicated rails, roads, road lanes, traction-guidance, ie, metro, suburban rail, priority bus corridors, BRTS or Metrolite in addition to augmentation of public bus transport services.

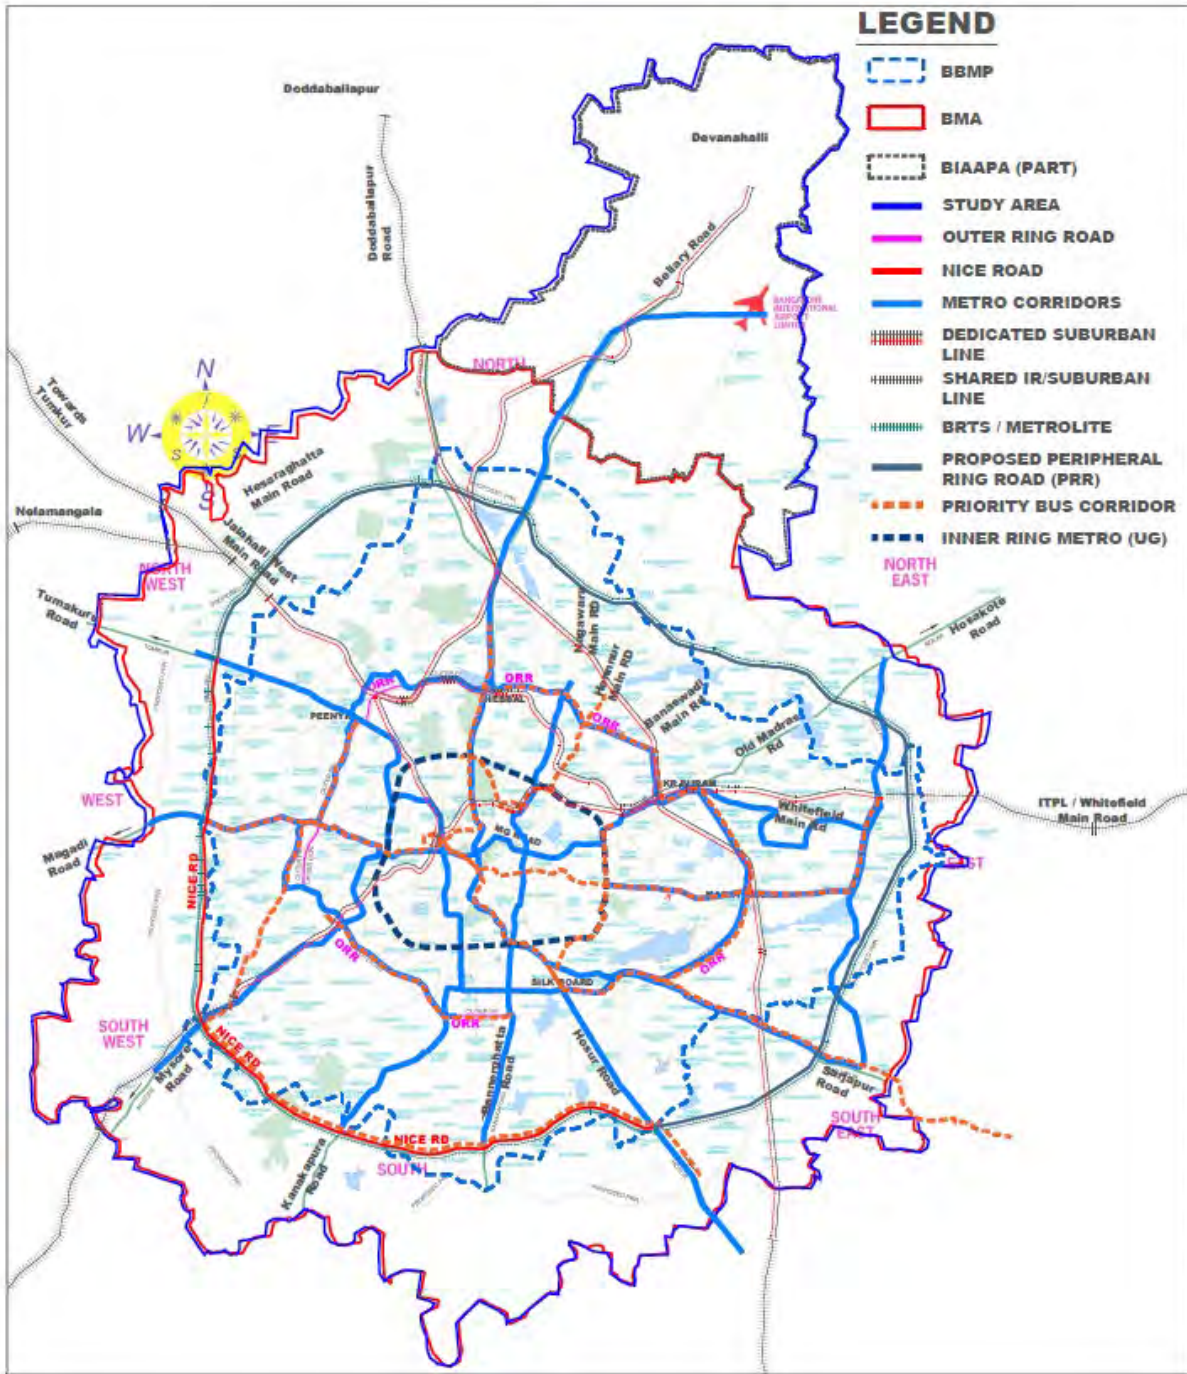

Figure 4-6: Public Transport Corridors

**Table 4-6: Public Transport Network**

| Public Transport Mode | Network Length (km) | Details    |
|-----------------------|---------------------|------------|
| Metro                 | 317                 | Table 4-2  |
| Suburban Rail         | 177                 | Table 4-3  |
| Priority Bus Corridor | 202                 | Table 4-4  |
| BRTS / Metrolite      | 107                 | Figure 4-5 |
| <b>TOTAL</b>          | <b>803</b>          |            |

**4.2.4 Intermediate Para-Transit and New Mobility**

Intermediate paratransit (IPT) and new mobility services increase the supply of mobility in the city, but may also have negative externalities on congestion, air pollution and GHG emissions, depending on their numbers, average occupancy and the quality of vehicles. Regulation of these services should strive to maximize their contribution to mobility in the city while at the same time minimizing their negative externalities. The IPT infrastructure should be provided and integrated with the road network, PT station areas, FoBs and Walkways access points and at designated locations near major activity centers and residential areas.

**4.2.4.1 Auto-Services**

The IPT sector in Bengaluru comprises of auto-rickshaws, which provide an alternative to personal vehicles for door-to-door connectivity and act as last-mile feeders to and from transit stations. Street hailed and largely driven by individual operators, ease of access and efficiency of the auto-rickshaw mode can be improved by following technological interventions and regulations concerning their governance and usage.

- i. Promote higher conversion rate to CNG engines for auto-rickshaws, and initiate engine reforms to address the higher emission of oxides of nitrogen by four-stroke engines.
- ii. Introduce electric rickshaw.
- iii. Consider vehicle design improvements to enhance road safety of auto-rickshaw occupants, specifically those involved in multi-vehicle collisions which have been found to result in greater injuries for auto-rickshaw passengers.
- iv. Incentivize high-quality electric auto-rickshaws through special dispensation of permits, with focus on vehicular quality for eligibility.
- v. Allow shared auto-rickshaw services to ply to and from mass transit stations, to reduce the vehicle kilometres travelled and pool trips moving in the same directions.
- vi. Regulatory reforms to enable fleet-based operations for dispatch services and app-based services, for improved operational efficiencies through reduced dead kilometres travelled and better demand-supply matching.
- vii. Enable location tracking and fleet operations of auto-rickshaws and taxis, enforce sharing of service availability and location data for commuters and parking regulation enforcement, and sharing of necessary operations data for planning authorities as part of the City Mobility Stack.

#### 4.2.4.2 New mobility

New mobility enterprises comprise the range of app-based services that commuters can access using mobile phones. In Bengaluru, these primarily include on-demand taxi and auto-rickshaw services, short-term bike and car rentals, corporate employee transport services, trip planners and digital fare payment technologies. While a number of new mobility models are currently prohibited by law, including motorcycle taxis, carpooling services and on-demand bus services, it is suggested that regulation of new mobility needs should be more nuanced and progressive, primarily guided by their negative externalities and per-commuter usage of scarce road resources. Following specific measures are suggested.

- i. Adopt a data-driven and analytical approach to engaging with new mobility business models and regulating their operations.
- ii. Promote shared mobility services that have the potential to shift people away from low-occupancy personal vehicles.
- iii. Amend the On-Demand Transportation Technologies Aggregator (ODTTA) Rules to strengthen road and passenger safety requirements and include provisions of greater accessibility and service levels for commuters as well as data-sharing requirements with responsible city agencies for improved mobility planning and for inclusion in the City Mobility Stack.
- iv. Conduct analysis to understand the necessity for limiting the number of auto and taxi permits in the city and to formulate objective benchmarks.
- v. Urban parking policy may have provisions for reserved spaces for shared mobility services, to incentivise their use over that of personal vehicles.
- vi. Enable greater public-private partnerships for transport between public transit agencies and the operators of new mobility services. In addition, services such as Heli-Taxi may also be explored.
- vii. The tariff or users fees for these modes shall be rationalized with the public transport fares to ensure that they are priced in way that does not reduce public transport uses.

### 4.3 Road Network Development Plan

The road infrastructure in Bengaluru needs quality improvement, design re-engineering and capacity addition in core as well as peripheral areas (areas outside ORR). Maintaining and upgrading the existing road infrastructure across the city to a uniform, consistent level of service is critical to ensuring the smooth flow of traffic and improving throughput of the road network.

#### 4.3.1 Throughput and quality improvement measures:

Re-engineering and upgrading existing road infrastructure is essential to increasing the overall throughput across all parts of the city. To the extent possible, all roads must be redesigned as complete streets that provide adequate space for pedestrians, cyclists, public transport and motorists, with the prioritization of environmentally sustainable modes that minimize the negative externalities of the urban transport sector. A massive effort to redevelop the existing roads on “tender-sure” norms is already under implementation. Those efforts need to be complemented by following measures to improvement the throughput.

- i. Resize the roads to maintain consistent carriageway widths and remove flow bottlenecks on arterial roads.
- ii. Develop long distance signal-free corridors on arterial roads that do not have high levels of pedestrian movements, by channelizing traffic from cross roads and constructing underpasses / flyovers without reducing existing capacity due to ramps by acquiring lands as required through direct compensation or TDR measure.
- iii. Re-engineer junction design and augment junction capacity, with responsive signal management and consideration of pedestrian flows.
- iv. Relocate bus stations away from the junctions to reduce movement across the lanes.
- v. All large economic centers and large residential complexes generating large number of commuters should be obligated in their building/ development plan approvals to establish bus and IPT bay within their land with NMT facilities for pedestrians.
- vi. Construct bus Shelters, bus bays and IPT bays on all roads based on the catchment area as well as footfalls on the corridors. These infrastructures should be universally accessible as well as ensure safety to women.
- vii. Construct long-distance elevated walkways from public transport stations to nearby economic centres.
- viii. Provide and maintain road markings and signage consistently across the entire road network to enable safer and more efficient traffic flows by reducing haphazard traffic weaving.
- ix. Develop framework for allocation of road infrastructure (sub-surface and above the ground both) for utilities, formulate standard operating procedure for laying and maintenance of utilities.
- x. Improve road construction and maintenance practices by bundling longer duration maintenance responsibility.

#### 4.3.1.1 Corridor Improvement Plan

Following corridors are proposed for improving the throughput capacity by adopting the above suggested measures with a view to facilitate a speed of 20-25 KMPH for public transport and convenience for NMT.

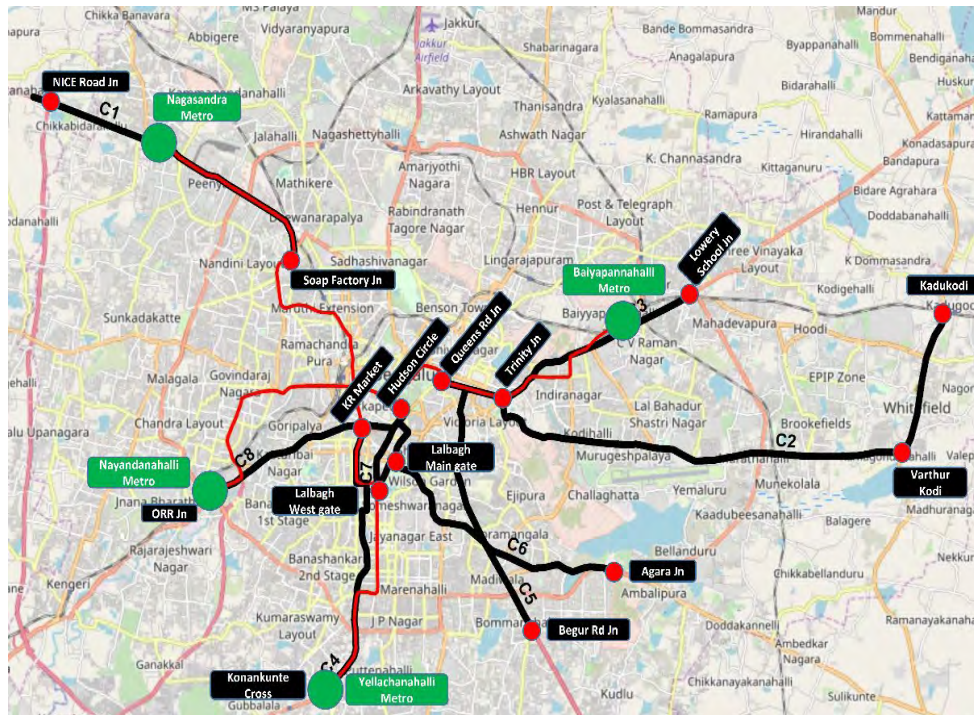

**Table 4-7: Corridor Improvement Plan**

| Sl. No | Corridor Name    | From                    | To                 | Approx. Length (km) |
|--------|------------------|-------------------------|--------------------|---------------------|
| 1      | Bellary road*    | Chalukya circle         | Hebbal Flyover     | 7                   |
| 2      | Old Madras road  | Trinity circle          | Medahalli junction | 22                  |
| 3      | Old Airport Road | Queens Junction         | Whitefield         | 19                  |
| 4      | Tumakuru Road    | Sangolli Rayanna circle | NICE Road Junction | 19                  |
| 5      | Sarjapura Road*  | Hosur road              | Carmelram Bridge   | 9                   |

| Sl. No       | Corridor Name                              | From                                       | To                     | Approx. Length (km) |
|--------------|--|--|------------------------|---------------------|
| 6            | Hosur road                                 | Museum Junction Road                       | Begur Road Junction    | 9                   |
| 7            | Hosur Main road – Sarjapura road           | Lalbagh Main gate (Lalbagh Police Station) | Agara Junction         | 9                   |
| 8            | Bannerughatta Road*                        | Hosur road, Anepalya Junction              | Kolifarm gate          | 13                  |
| 9            | Kanakapura Road                            | K.R. Market                                | NICE Road Junction     | 15                  |
| 10           | Mysore Road                                | Hudson circle                              | Jnanabharathi Junction | 9                   |
| 11           | JC road / Lalbagh Main road (one way Loop) | LalBagh West Gate                          | Hudson circle          | 6                   |
| 12           | Magadi Road*                               | Old Binni Mill                             | NICE road              | 12                  |
| 13           | West of chord Road*                        | Soap Factory                               | Mysore road            | 9                   |
| 14           | Outer Ring Road*                           | Full Length                                |                        | 62                  |
| <b>Total</b> |  |  |                        | <b>220</b>          |

\* Corridors not shown in Figure 4-7

The plan may require selective acquisition of small areas of land for bus bays, junction improvements and removal of bottleneck, but does not entail full-length widening of the corridors. The corridors mentioned in Table 4-7 also includes 12 corridors identified as High Density Corridors (HDCs) in Bengaluru, which carry substantial volume of traffic. Hence, these corridors should be improved and well maintained round the clock to ensure seamless and safe movement of pedestrians, buses and personal vehicles.

**Figure 4-7: Corridor Improvement Plan (Phase 1)**

The vision for HDCs are as follows:

- The roads would be operated to ensure maximum throughput is achieved
- The roads would provide safe opportunity for all road users to safely use the corridor, including people of all abilities
- The roads would aid in sustaining the environment (low carbon footprint) and economy of the city

Further, the HDCs are recommended to be improved on the following broad guidelines:

- Provide consistent number of lanes and carriageway width, rationalized by traffic demand, for smooth flow of traffic
- Ensure road surface is free of potholes and undulations that could slow traffic
- Space out junctions not be less than 500m and where possible avoid providing right turns at junctions to achieve higher throughput along the corridors. Where right-turning movements are restricted U-turns may be provided downstream appropriately
- Provide rumble strips upstream of a midblock or an un-signalized junction pedestrian crossings to ensure safety of pedestrians
- Provide footpaths with at least 1.8m clear walking space, without any obstructions. More clear walking space may be provided at locations where high pedestrian volumes are anticipated. Ensure footpaths are continuous and have even walking surface
- Provide railings on footpath or median or both as required to ensure pedestrians are protected vehicular movement.

- Provide FoB's or subways to facilitate midblock pedestrian crossing, especially on roads with more than 4 lane bi-direction traffic exists
- Provide channelizing islands for streamlining movement of vehicles and for adequate pedestrian refuge
- Place all road signs and markings in a manner that it effectively conveys the message to motorists and ensure that signage does not obstruct pedestrian movement.
- Prohibit on-street parking on the high density corridors. Also prohibit on-street parking and on-street vending 50 m on all major cross streets from the point where they intersect HDCs
- Provide adequate shelters and waiting space at all bus stops, without obstructing pedestrians on footpath
- Establish service level agreement for maintenance of the HDC roads to ensure there is a quick turnover of maintenance works. Entrust maintenance of HDCs to professional agencies

#### 4.3.1.2 Junction Improvements

50 junctions in the study area are critical as the traffic volumes at these junctions have already exceeded capacity during peak hours. Those junctions are proposed for improvements through combination of closure of medians at certain intersections, prohibition of free right turns, provision of adequate sight distance, adequate corner radii, sufficient turning radii, channelizers/division islands, flaring approaches towards intersections, pedestrian and cyclist crossing facilities and signs/lane-markings/lighting, and relocating bus stops away from the junctions. Signal priority for movement of public buses should be designed and enforced at all major intersections.

**Table 4-8: List of Junction Improvements**

| Sl. No. | List of Junctions                      | Sl. No. | List of Junctions                              |
|---------|--|---------|--|
| 1.      | Vellara Junction                       | 2.      | Bannerghatta Road – Tilak Nagar Road           |
| 3.      | Football stadium Junction              | 4.      | Bannerghatta Road – 39 <sup>th</sup> Main Road |
| 5.      | Hosmat Hospital Junction               | 6.      | Bannerghatta Road-Outer Ring Road              |
| 7.      | Trinity Church Junction                | 8.      | Bannerghatta Road-Bilekahalli Road             |
| 9.      | Old Airport Commando Hospital Junction | 10.     | Bannerghatta Road-BDA 80 Feet Road             |
| 11.     | Ulsoor Road Junction-CMH Hospital Road | 12.     | South End Circle                               |
| 13.     | Bhaskaran Road-Old Madras Road         | 14.     | RV Road-Inner Ring Road                        |

| Sl. No. | List of Junctions                                 | Sl. No. | List of Junctions                        |
|---------|---|---------|--|
| 15.     | Surunjan Das Old Airport                          | 16.     | Banashankari Bus Stop Junction           |

#### 4.3.1.3 Foot over Bridges/Walkways

FOBs are proposed at 154 locations to facilitate safe and efficient movement of pedestrians.

**Table 4-9: List of Foot Over-Bridges**

| Sl. No.                 | List of Junctions  | Sl. No. | List of Junctions  |
|-------------------------|--|---------|--|
| <b>OLD AIRPORT ROAD</b> |  |         |  |
| 1                       | Old Airport Road Near Marathahalli, Akash Vihar.   | 2       | Old Airport Road From Magnum Hospital to Konenaagrahara bus stop                 |
| 3                       | On Varthur Road near admin gate of HAL, LCA Tejas Division   | 4       | Old Airport Road (HAL post office) – from Post office to HAL.                    |
| 5                       | Near Manipal Hospital ,on old air port road  | 6       | HAL Old air port road near Kundalahalli junction.                                |
| 7                       | Near ASC Centre and Records, Old Airport Road  | 8       | Varthur main road near Thubarahalli junction.                                    |
| <b>RACE COURSE ROAD</b> |  |         |  |
| 9                       | Near Basaveshwara Circle near Race Course Road from Govt RC College compound side to Bharatiya Vidya Bhavan compound side                                  | 10      | At Race course Road  |
| <b>QUEENS ROAD</b>      |  |         |  |
| 11                      | Near Balekundri Circle (Indian Express on Queen road from Queens road to Park temple from Shivajinagar to Indian Express and to Air Chaina Cuningham Road. | 12      | Queens Road near Congress Party Office- from Star chamber to Congress committee. |
| <b>MG ROAD</b>          |  |         |  |
| 13                      | M.G Road, Connect to Boulevard, Rangoli Metro Art Centre   | 14      | Residency road near Bishop Cotton Girls School.                                  |
| 15                      | Queens road from Cubbon park corner to KSCA Stadium gate and M.G.Road from Mahatma Gandhi park to Bible Society Compund on M.G. Road.                      | 16      | M.G Road Near Trinity junction.  |
| 17                      | Residency road near Ritz Carlton   | 18      | Kensington road infront of M.G.Mall.   |
| 19                      | Brigade Road Junction Moto Royal Arcade  |         |  |
| <b>OUTER RING ROAD</b>  |  |         |  |
| 20                      | Outer Ring road HBR layout, 4th and 5th block - BESCO near Ambedkar ground.  | 21      | Outer Ring road near Sumanahalli.  |
| 22                      | Kamakya theater, Kattariguppe, outer ring road   | 23      | Near Dr. Rajkumar Memorial, ORR  |
| 24                      | Outer Ring road Marathahalli near Kala Mandira.  | 25      | Outer Ring Road near Laggere Bridge.   |
| 26                      | Bellanduru Central Mall, ORR, Ward no 150  | 27      | Outer Ring road at Forest Office near Bheema Jewellers.                          |
| 28                      | Outer Ring road near Ibaluru junction  | 29      | Outer Ring road near Navajeevan Hospital.  |
| 30                      | Outer Ring road in front of Lumbini Garden.  | 31      | Near croma Showroom.   |
| 32                      | Outer Ring Road near Vijayabank colony.  | 33      | Outer ring road near B.Narayanapura.   |

| Sl. No.                 | List of Junctions  | Sl. No. | List of Junctions   |

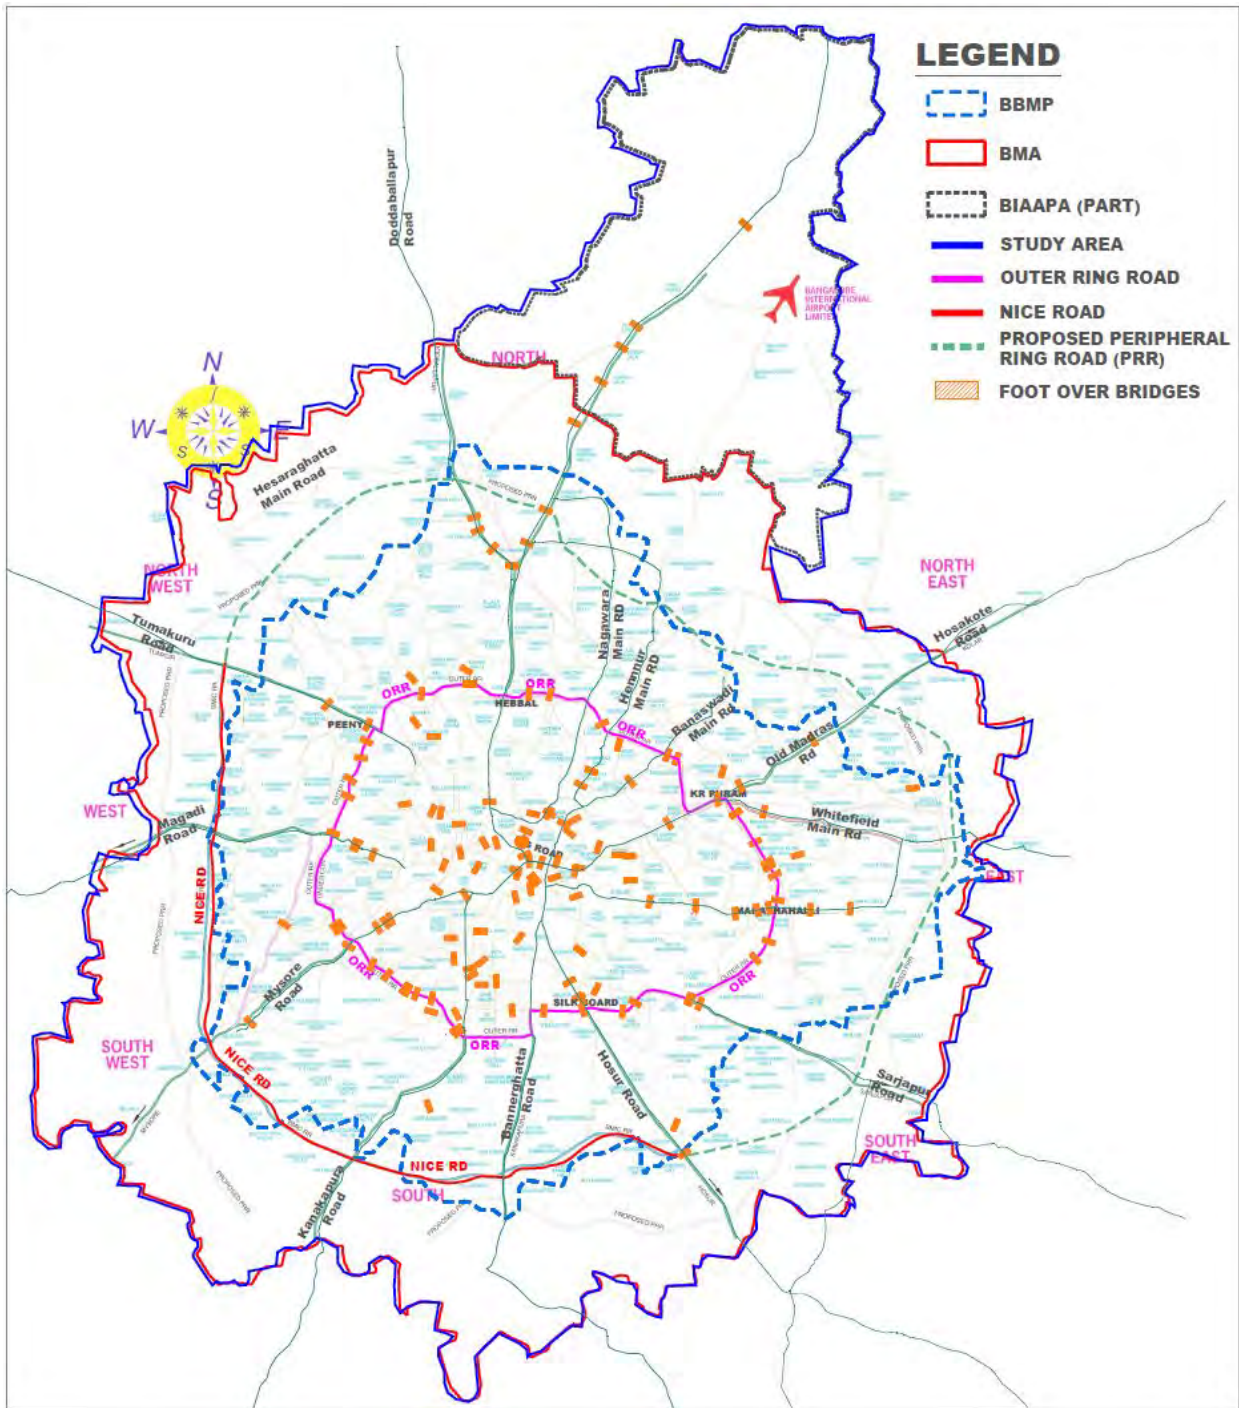

Figure 4-8: Foot Over Bridges

#### 4.3.2 Capacity addition

Road infrastructure should be judiciously expanded to meet rapidly growing transport demand, while at the same time earmarking a part of the additional capacity for public transport, disincentivizing usage by private transport modes. The focus should be on equitable allocation of additional road infrastructure, to ensure that all residents and parts of the city have adequate access to road infrastructure that is well-connected, and to ensure that all modes of motorized and non-motorized transport are accounted for in the design and planning of roads.

The road capacity augmentation should happen hand in hand with management of demand for private modes of transport through appropriate parking policy and charges, congestion fee, etc.

- i. Augment road capacity with at-grade widening, wherever feasible, with prioritization of road space allocation for pedestrian movement and public transport for more complete streets. The new areas planned should have wider Right of Way (RoW) than the current practice to meet the future requirement.
- ii. Construct elevated roads on east-west, north-south and central ring corridors with adequate capacity, with no section having capacity less than aggregate capacity of sections contributing traffic to that section, and properly designed ramps at regular intervals to enhance connectivity and allow smooth traffic weaving.
- iii. Earmark a significant part of the new road capacity, ranging from one-third to one-half, on elevated corridors, PRR, and other new road construction, for public transport exclusively with necessary components such as accessible bus stops, turn-outs for buses at stops, and separated bus lanes.
- iv. Impose congestion or user fee on all private vehicles using elevated corridors at any time of the day with telemetry or camera based detection and automatic fee collection system, while encouraging public transport through free entry and subsidizing bus fare to commuters travelling through PT.
- v. Prioritize construction of Peripheral Ring Road (PRR) to facilitate future planned growth of the city. Further earmark another Ring Road at least 4-5 kms away from the planned PRR to accommodate future growth of the city.
- vi. Develop grid roads, at every 1 km by 1 km, in areas being opened up for fresh development, including those abutting the PRR, through town planning schemes.
- vii. Take-up rail cum road infrastructure on arterial and ring roads to reduce adverse impact of exclusive earmarking of road space for rail-based public transport.
- viii. Develop alternative route to provide access to the Kempegowda International Airport (KIA).

#### 4.3.2.1 Capacity augmentation of major junctions and sections

Hebbal junction, Central Silk Board junction and common section of the Outer Ring Road and Old Madras Road between K. R. Puram railway station and Tin factory have traffic volume of more than 3.5 lakhs PCUs per day. The capacity of these junctions is much lower leading to average traffic speed of less than 10 kms per hour during peak hours.

i. **Hebbal Junction:**

It is proposed to provide additional 3 lane flyovers in either direction from city to airport and from airport to city in addition to the existing flyovers. Additionally, an underpass is proposed to be provided for the traffic from Tumkur to KR Puram.

To provide a dedicated access from the proposed elevated road corridor to the airport flyover through the existing flyovers will be explored.

ii. **Central Silk Board Junction:**

With setting up of 2 metro stations at this junction, the volume of first and last mile commute from this junction will see a manifold increase besides the existing level of congestion. The already planned elevated flyover on east west access alone will not be able to ease the congestion. Sub-ways to connect north and east axes and augmentation of junction capacity by constructing service roads on existing storm water drains without disturbing the water flow are proposed.

iii. **K.R.Puram – Tin Factory – Benniganahally section of ORR & OMR:**

This section is likely to see very large increase in first and last mile commute with construction of 2 Metro lines and 2 metro stations. At-grade widening of the road on southern side to be six lanes and northern side to be 5 lanes is proposed. In addition, augmentation of Benniganahalli flyover over the railway tracks by constructing additional 2-lane loop from east to north in Phase-1 of the CMP is proposed. The additional 2-lane loop from north to east may be taken up during phase-2. In view of the proposed suburban rail and additional railway tracks of the new railway line crossing the ORR north of the flyover at a distance of 100 – 150 meters, widening of that section of the ORR is also proposed. The layout design of the K.R.Puram – Tin Factory – Benniganahalli – Kasturinagar section should be done together considering all major projects coming up in the section and the needs of the multi-model integration.

#### 4.3.2.2 Widening of roads

Following major roads are proposed for capacity augmentation by at-grade widening to uniform 6 lanes through Transferrable Development Rights (TDR) and TOD incentives.

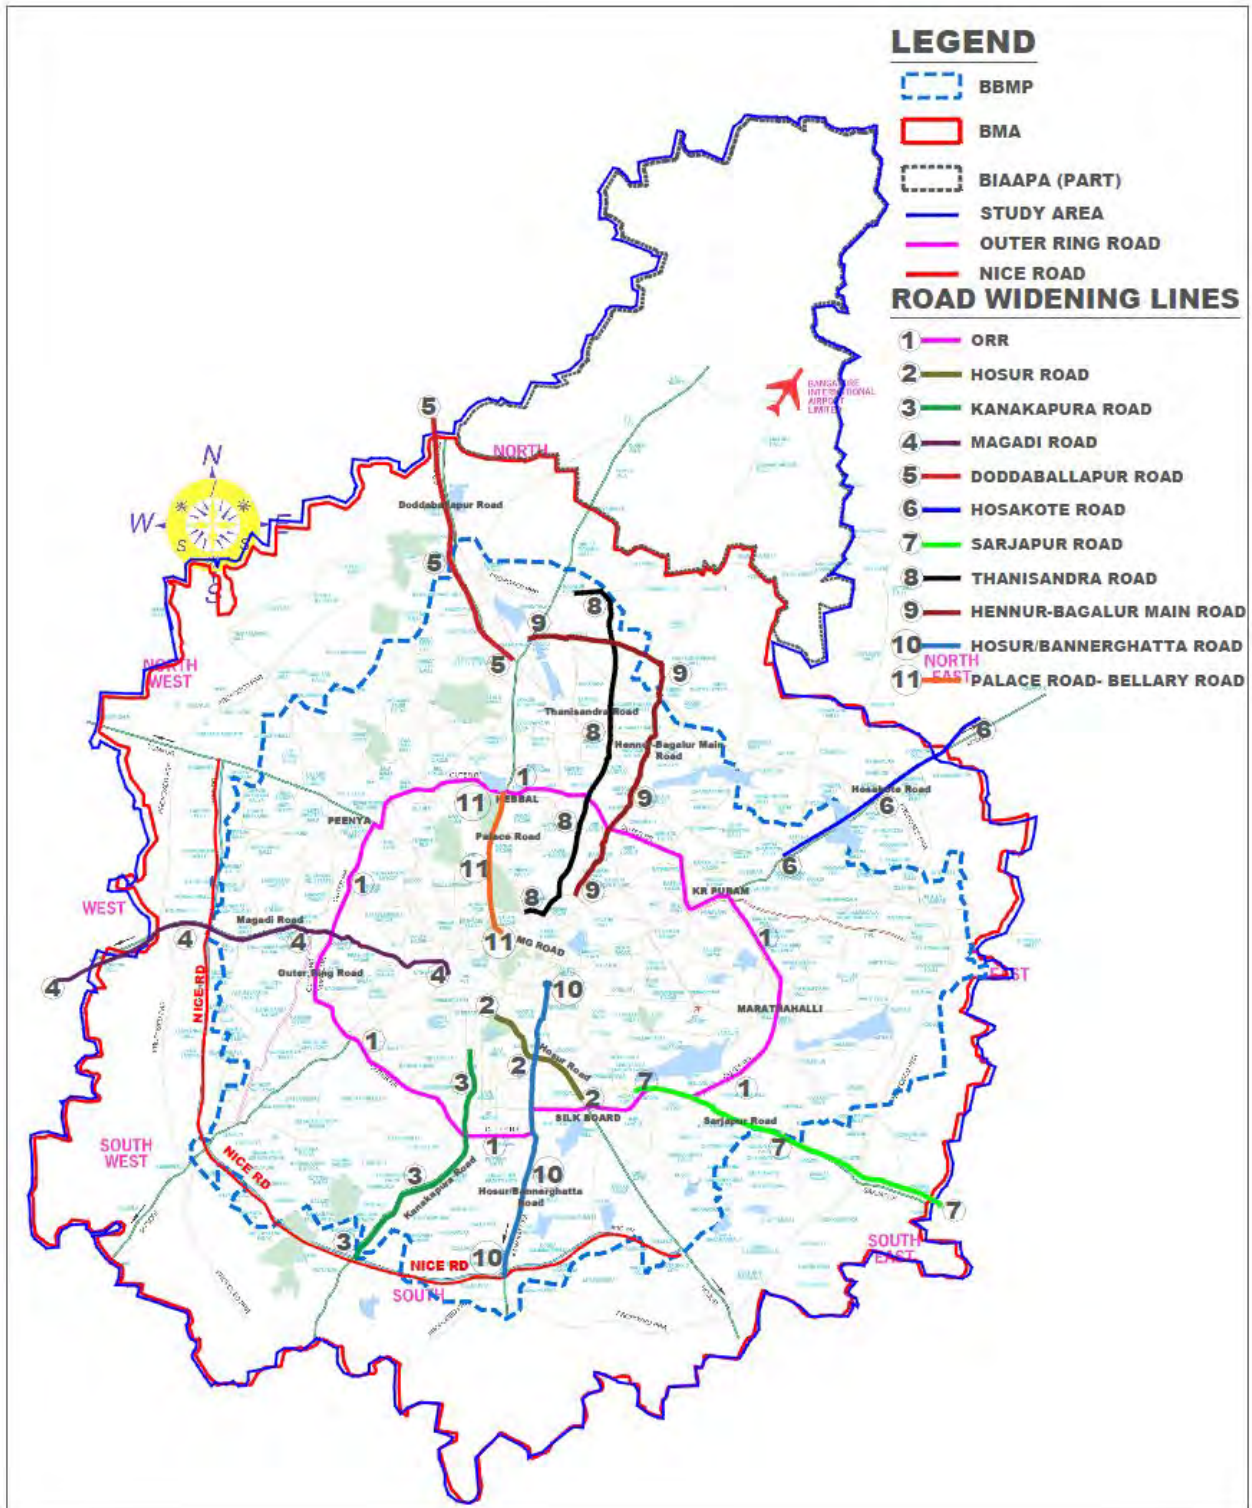

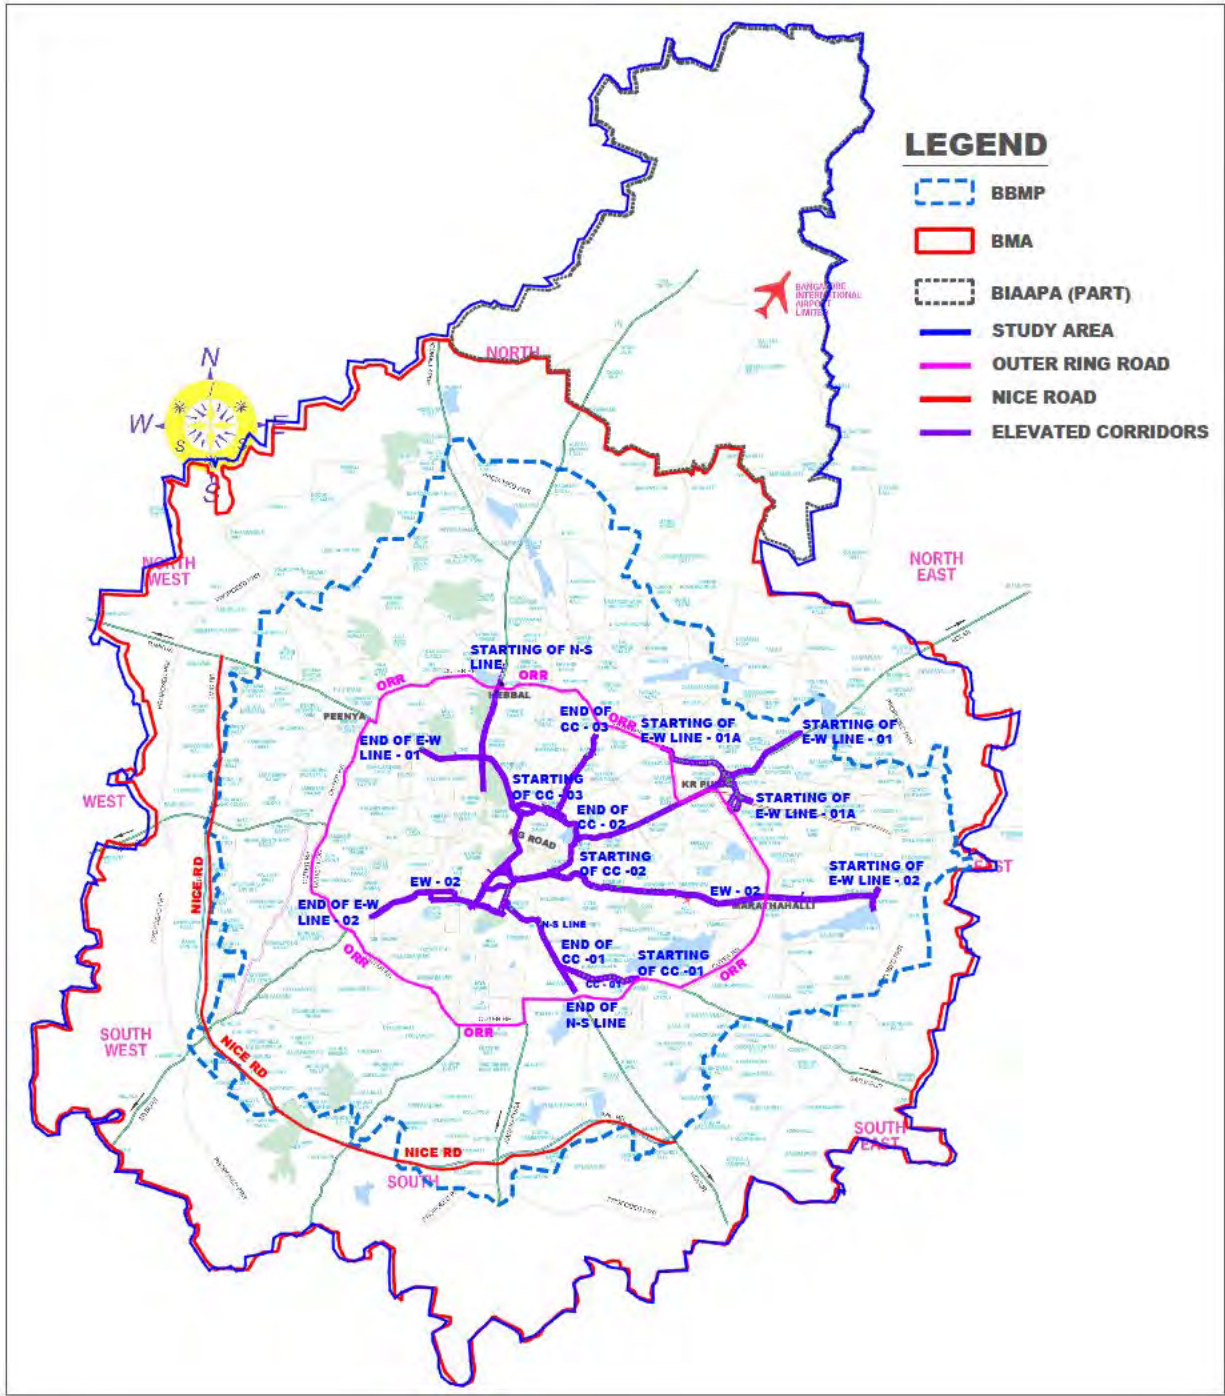

Figure 4-9: Road Widening Plan

**Table 4-10: Road Widening Plan**

| Sl. No       | Corridor Name  | From                       | To                | Approx. Length (km) |
|--------------|--|----------------------------|-------------------|---------------------|
| 1            | Outer Ring Road<br>(signal free and with service lanes throughout) |                            |                   | 58                  |
| 2            | Hosur Road   | Madiwala Police Station    | Lalbagh Main Gate | 6                   |
| 3            | Kanakapura Road  | MNK Park                   | NICE Corridor     | 12                  |
| 4            | Magadi Road  | Tavarakere                 | MariappanaPalya   | 20                  |
| 5            | Doddaballapur Road   | Yelahanka                  | Rajanukunte       | 13                  |
| 6            | Hosakote Road  | Baiappanahalli             | Hoskote           | 11                  |
| 7            | SarjapurRoad   | Agara Lake                 | Sarjapur          | 15                  |
| 8            | Thanisandra Road   | Cantonment Railway Station | BagalurMain Road  | 18                  |
| 9            | Hennur – BagalurMain Road  | Frazer Town                | Bagalur Main Road | 18                  |
| 10           | Hosur Road / Bannerghatta Road                                     | Richmond Road              | NICE Road         | 14                  |
| 11           | Palace Road – Bellary Road   | Sankey Road                | Hebbal Flyover    | 7                   |
| <b>Total</b> |  |                            |                   | <b>192</b>          |

#### 4.3.2.3 Elevated Road Corridors

There is a need for augmenting the capacity of arterial roads in the CBD areas, as well as beyond the ORR. While at-grade augmentation should be the default option and pursued for peripheral areas, limitations of land acquisition in the core area, i.e., Planning Area A, may require consideration of road capacity augmentation through elevated roads. The elevated corridors should be designed with particular attention to the preferential allocation of road space for public transport vehicles, regulation on private vehicles, and facilitation of inter-modal mobility as brought out in section 4.3.2. The length of proposed elevated corridors is 88 km. Some of the elevated corridors such as North South Corridor (NS), Central Ring Corridor (CC) and 2<sup>nd</sup> East West Corridor (EW 02) should be reviewed as there is a conflict with the metro corridors. The most cost effective system from perspective of efficient and sustainable mobility solution should be chosen.

**Figure 4-10: Elevated Road Corridors**

### 4.3.2.4 Peripheral Ring Road

Peripheral Ring Road of 66 km length and 100-meter width is proposed on the north-west periphery of the city with complementary connectivity to NICE Road on the south-east periphery and provision in the middle for BRTS or traction guided at-grade Metrolite. The entire road should be access-controlled, signal free, elevated U & right turns. In addition, the area of 2 km width on either side should be developed following TOD norms.

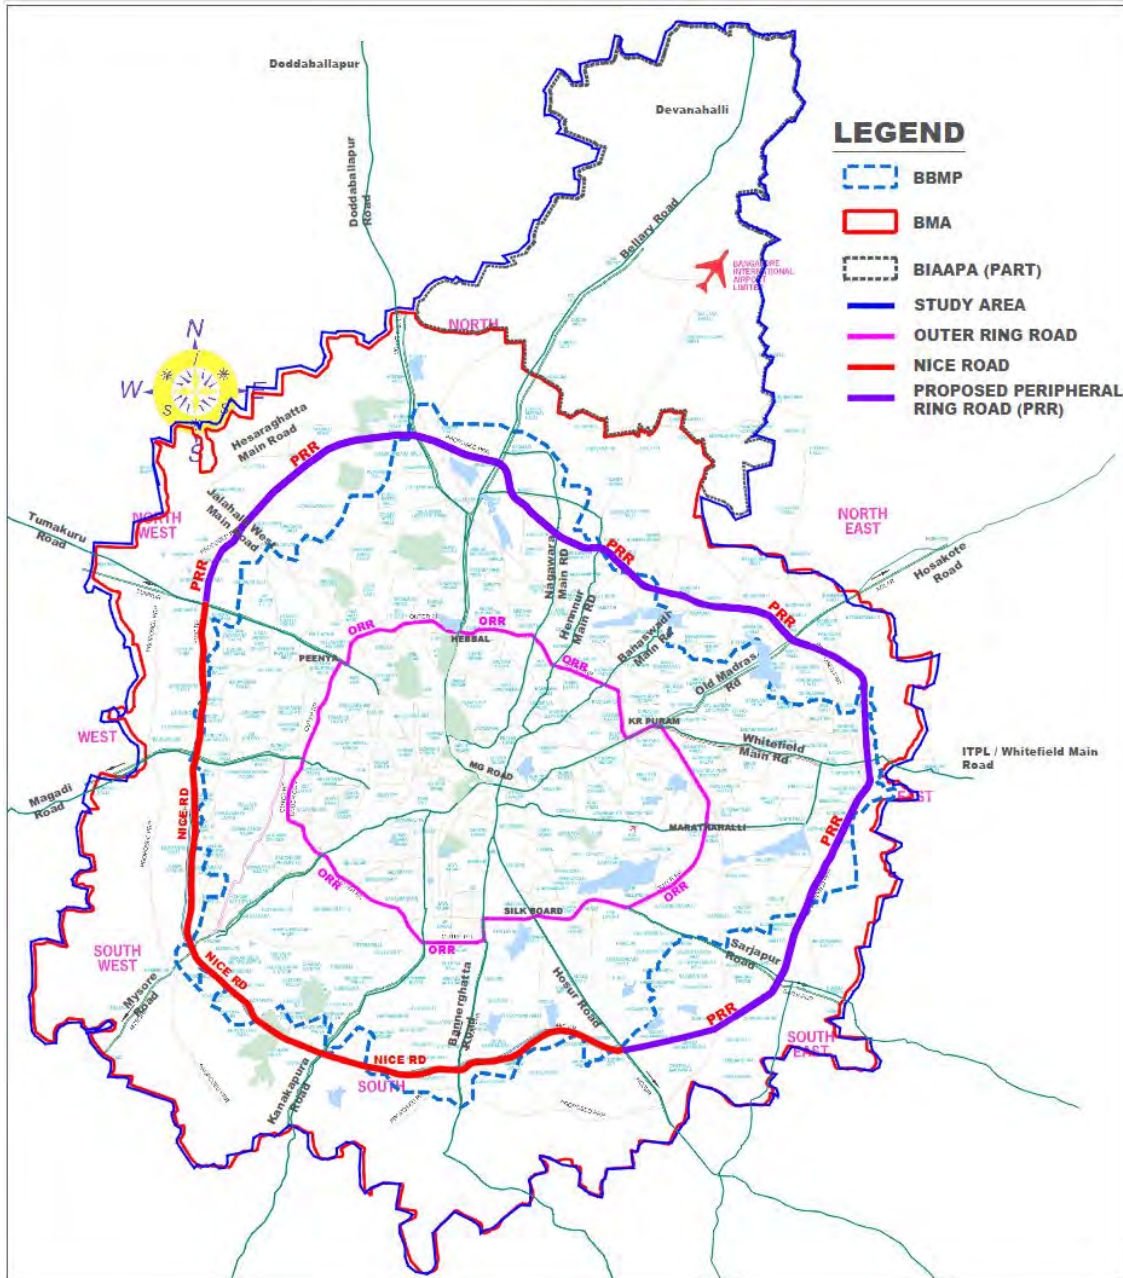

Figure 4-11: Peripheral Ring Road

#### 4.3.2.5 Development of Missing Links

Due to unplanned development in the city periphery, the continuity of roads for circulation is hampered to missing links. Such missing links on important roads needs to be identified and developed to improve vehicular and pedestrian circulation in those areas.

#### 4.3.3 Parking Infrastructure

With up to 25 per cent of road width of several roads taken up by parked vehicles, there is a need for comprehensive parking policy and management to improve the efficiency of road usage for traffic flow. Where rules and parking fees exist, they are often limited to certain locations, nominally priced and weakly enforced. This not only contributes to the inefficiencies of urban transport systems but also exacerbates social inequality of road space allocation with the prioritized use of public roads for parking personal vehicles at the expense of free vehicular movement and pedestrian rights-of-way. Provision of parking infrastructure and parking management must consider on-street and off-street parking, and the use of parking policy to dis-incentivize excess use of private vehicles, especially along transit corridors.

On-street parking should get the lowest priority for road space usage, while higher priorities are assigned to NMT infrastructure including footpath, cycle track, cycle stations, bus and IPT bays. The management of on-street parking is an important part of improving the efficiency of road infrastructure use. The rules for on-street parking should be guided by the following considerations:

- i. On-street parking to be prohibited entirely on high-density roads that are operating at full capacity or at V/C ratios of 1 and higher, and within 100 metres of all junctions of such roads.
- ii. On-street parking on roads with V/C ratio less than 1 should be considered only after ensuring the provision of NMT infrastructure such as pedestrian footpaths and bicycle lanes, transit infrastructure such as bus stops and other curb-side requirements such as emergency vehicle and delivery vehicle zones and designated paratransit zones.
- iii. Only short-term parking should be permitted in on-street parking spaces.
- iv. Parking spaces on tender-sure roads should be used for bus and IPT bays or at the most for short-term parking with high fee instead of the current practice of long-duration parking.
- v. **Private vehicle parking:** For non-transport vehicles, proof of parking space allocated for new vehicle to be pre-requisite for registration of new vehicles, either in their own residence or at a parking facility. If parking space is being leased at an external facility, details of lease of at least one-year time to be furnished and subsequently updated annually. High penalties to be imposed for non-provision of parking space in violation of building byelaws.
- vi. **Transport vehicle parking:** Transport vehicle owners, be they transport aggregators, private fleet operators, IPT operators or individuals, should be required to show proof of parking prior to registration.
- vii. **Trip generating economic centres:** Large economic centres such as wedding halls, restaurants, movie theatres, shopping centres, etc. that have widely varying traffic

flows should be obligated to have arrangements for peak load parking, and permits for these land-uses should be contingent on the proof of peak load parking spaces, which may be shared between different trip generators.

- viii. Time window of 2 years should be provided for existing vehicle owners to organize and submit proof of parking space availability, failing which penal fee should be charged for on-street parking in residential areas with the proceeds to be used for building pooled parking infrastructure in those areas.
- ix. The required changes are to be made in the motor vehicle regulations and municipal corporation byelaws, supplemented by near-real time linking of motor vehicle registration system and building plan approval system to enforce the parking regulations.

Removing most of the on-street parking stock and reallocating road space to more productive uses should go hand-in-hand with the creation of off-street parking, which should provide the greater supply of parking in the city and be guided by the following considerations:

- i. Parking supply to be restricted along transit corridors to discourage personal vehicles and incentivise transit use, and rental of parking spaces to be separate from rental of housing or commercial units.
- ii. Parking fee to be the principal instrument to discourage use of private vehicles by fixing the fee as close to the economic cost of the parking infrastructure as is practical and enforcing the parking regulations.
- iii. Parking fees for off-street parking to be lower than that of on-street parking (where on-street parking is allowed), to ensure that off-street parking is the preferred option for commuters.
- iv. Extensive park and ride facilities to be limited to terminal transit hubs, with access to stations in the city centre to be encouraged through walking and feeder services.
- v. Mechanical parking and multi-level parking facilities should be considered at main economic centres in view of limited land availability and high cost of land.

Effective enforcement mechanisms are necessary to uphold any regulatory framework for parking. Enforcement officers may be designated to monitor violations in parking and no-parking areas. Technologies such as handheld devices, video analytics and centralised enforcement databases can support more effective enforcement while mobile applications make it easier for vehicle users to reserve and pay for parking.

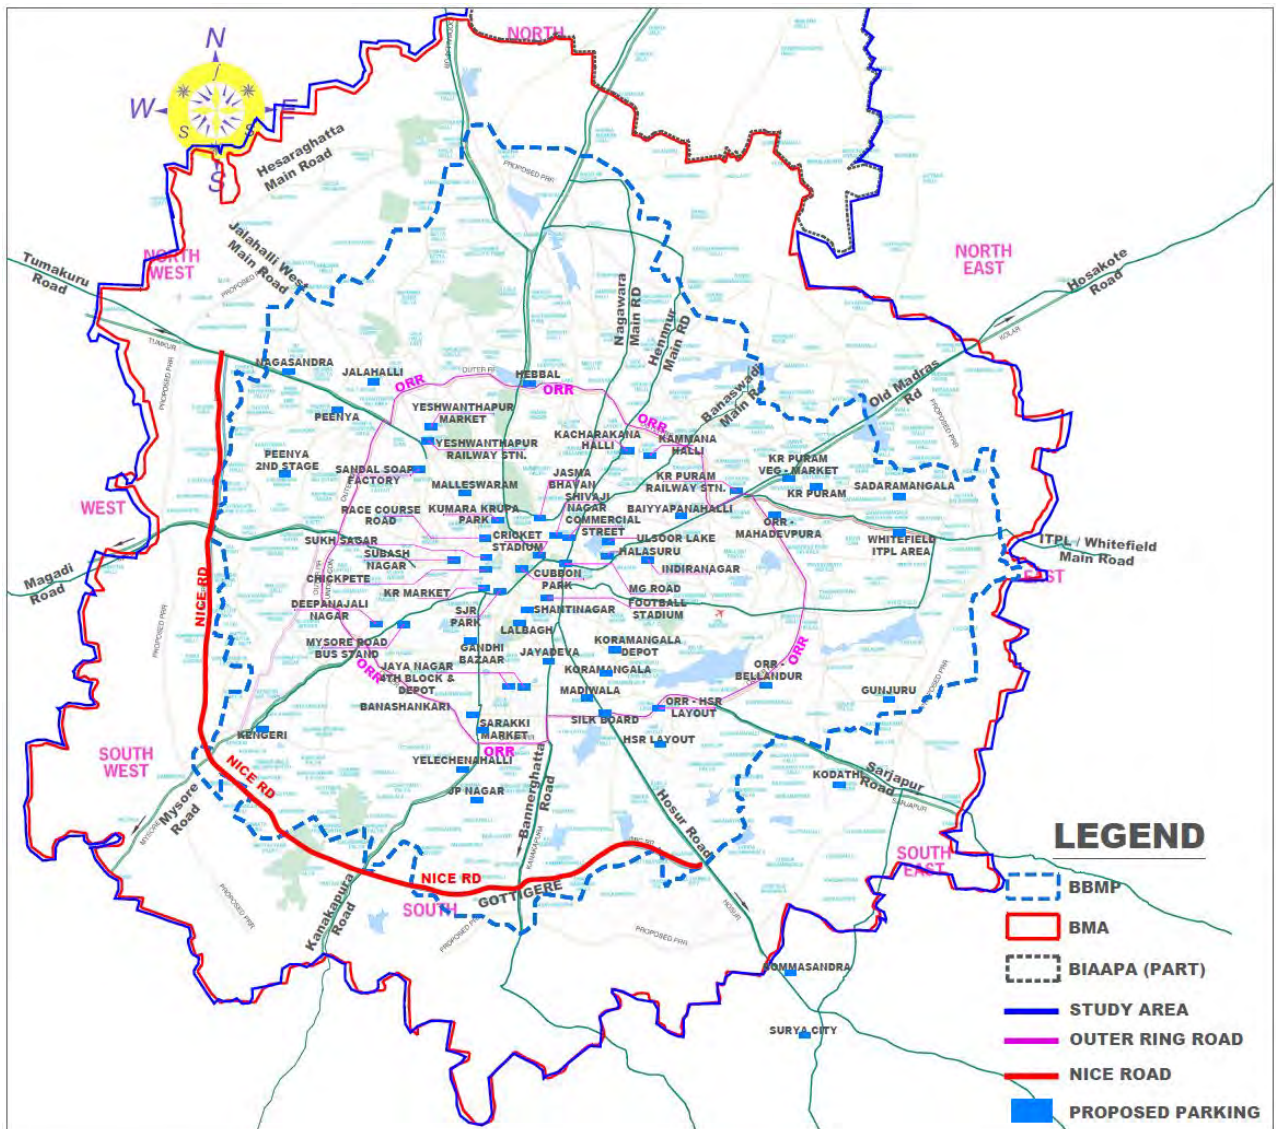

Currently some public off-street parking exists at locations mentioned below within the core area of Bengaluru. However, these off-street facilities need to be refurbished to ensure that these facilities are well utilized. In, addition to these BMTC has established 10 Transit & Traffic Management Centers (TTMC) across the city and these TTMCs also accommodate some amount of public parking to facilitate park and ride.

**Table 4-11: Existing Off-Street Parking in Core Area to be Refurbished**

| SI. No. | Location                     | Approximate Capacity (in PCE) |
|---------|------------------------------|-------------------------------|
| 1.      | Public Utility Building      | 150                           |
| 2.      | Police Grounds (BRV Grounds) | 200                           |
| 3.      | Garuda Mall                  | 250                           |
| 4.      | Basava Bhavan                | 25                            |
| 5.      | JC Road                      | 300                           |
| 6.      | SKR Market                   | 120                           |
| 7.      | Kalasipalyam                 | 325                           |
| 8.      | Chota Maidan                 | 100                           |
| 9.      | Mayo Hall                    | 100                           |
|         | <b>Total</b>                 | <b>1570</b>                   |

Apart from refurbishing the existing off-street parking lots, development of new parking lots within the study area are proposed at the following locations.

**Figure 4-12: Proposed off street parking in core areas to be developed**

**Table 4-12: Proposed off-street parking in core area to be developed**

| SI. No. | Potential Off street Parking Locations               | Area Type    | Approx. Capacity in PCE |
|---------|--|--------------|-------------------------|
| 1       | Krishnarajendra Market                               | Market       | 300                     |

|         | <b>TOTAL</b>                           |           | <b>17,000</b>           |

#### 4.3.4 Road Safety

While improving road infrastructure and augmenting capacity of roads, it is imperative to ensure road safety and take measures to minimize crashes. It is proposed that the following strategies and interventions are adopted and implemented scientifically at the city level.

- Adoption of the safe system approach: The safe system approach includes a road transport system that is designed to accommodate human error and protect people from death and serious injury. The cornerstones of this approach are safer roads, safer speeds, safer vehicles and safer road users, all of which must be addressed in order to eliminate fatal crashes and reduce serious injuries.
- Creating a safer system for all: Transport Systems with extensive mass transport, good conditions for walking and cycling and fewer cars on the road driving short distances at safer speeds tend to be safe.
- Speed management: Lower vehicle speeds lessen the risk of fatalities.
- Enforcement of safety laws: Road Safety laws have been enacted by the Central Government. It is proposed to institute appropriate measures to strengthen and improve the quality of enforcement of these laws with support from the city Traffic Police.
- Education and training of road users: It is important to prioritize road safety education, awareness and training for all categories of road users.

- Campaigns for awareness generation: Regular awareness generation campaigns on the importance of following traffic rules and to propagate good road safety practices among the community are proposed to be conducted at regular time intervals.
- Set output targets for road safety: Establishing specific targets for road safety initiatives at the beginning of the projects will help facilitate evaluation of the interventions and follow-ups.
- Data based approach to road safety: It is proposed that a data-based approach is adopted to improve road safety. Therefore, data collection on road crashes is to be properly coded, entered in a system, processed, analyzed, disseminated and used. Data should form the backbone of the proactive and reactive interventions towards improving safety on roads.
- Road Safety Action Plans: It is proposed that for high risk zones road safety action plans are developed and implemented.
- Post-Crash response: The post-crash response should aim to minimize the long-term consequences of road traffic injury through prompt retrieval and timely and effective treatment and rehabilitation.
- Road Safety Fund that is accrued from cess on MV tax and violation fines in Bengaluru should also be considered to fund relevant CMP projects.

## 4.4 Non-Motorized Transport Plan

A part of all existing road networks should be earmarked and improved for non-motorized transport comprising of walking and bicycling, which are the lowest-impact transport modes with no negative externalities. Encouraging more NMT trips will primarily require the provision of adequate road infrastructure to enable ease of walking and bicycling and ensuring the safety of pedestrians and bicyclists.

- i. Invest in the expansion of pedestrian infrastructure such as that mandated by the tender-sure road design, which ensures universally accessible footpaths, minimum footpath widths, and elements of pedestrian safety such as bollards.
- ii. Ensure the presence of continuous and well-maintained footpaths and elevated walkways, and curb footpath encroachments across the entire road network with a focus on high-density areas.
- iii. Design road networks to provide safe crossings at regular intervals, preferably at-grade and alternately, via elevated walkways.
- iv. Prioritize walking and bicycling infrastructure in the catchment areas of transit stations, to promote NMT as the default mode for first and last mile connectivity.
- v. As much as possible, provide exclusive bicycle lanes in existing roads and include bicycle lanes in the design and construction of new roads.
- vi. Provision bicycle docking and parking infrastructure at regular intervals and integrate docking/ parking infrastructure at transit stations and bus stops.
- vii. Ensure seamless and integrated NMT access for all public transport facilities with special care towards women safety.

Table 4-13: NMT Improvement Plan

| NMT Infrastructure     | Length (km) | Agency |
|------------------------|-------------|--------|
| Footpath + Cycle Track | 169         | BBMP   |
| Tender Sure Roads      | 103         | BBMP   |
| Footpath + Cycle Track | 431         | DULT   |
| Footpath               | 224         | DULT   |
| Footpath               | 150         | BMRCL  |
| <b>Total</b>           | <b>1077</b> |        |

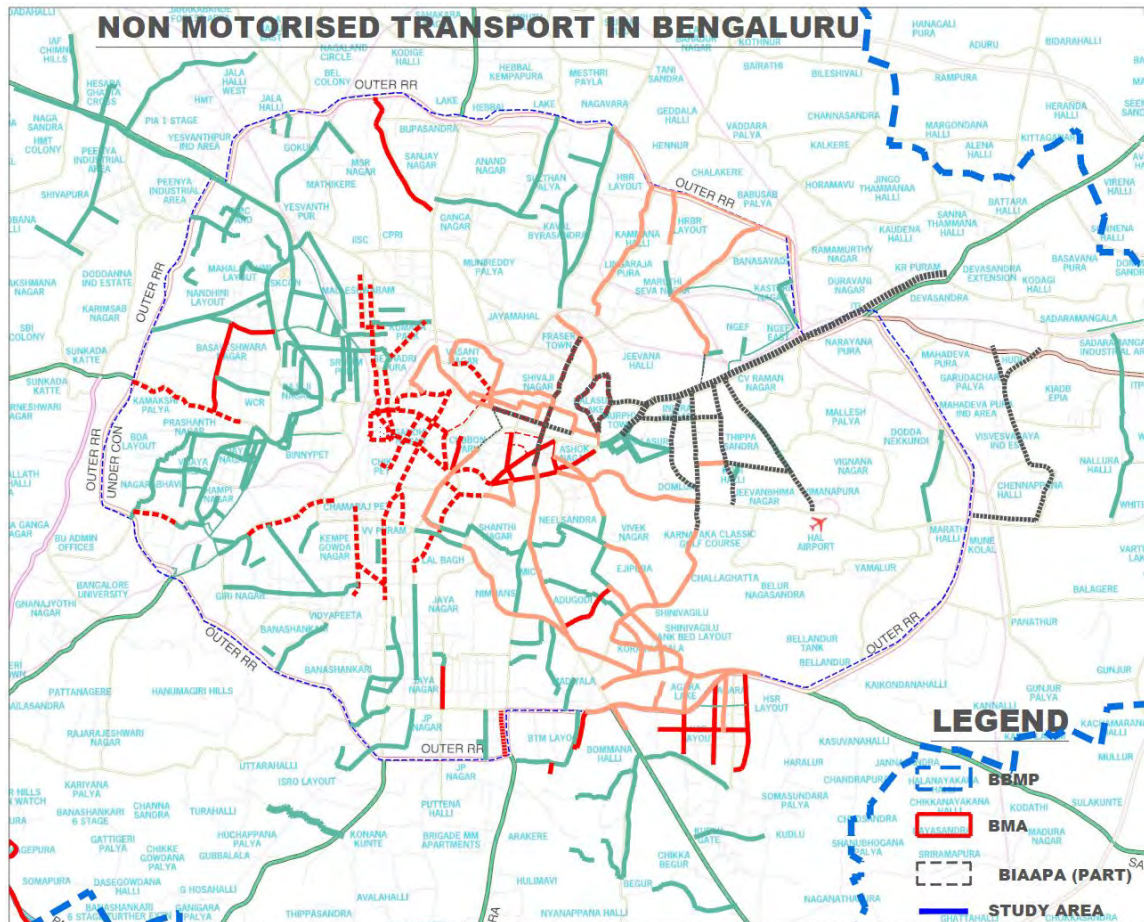

Figure 4-13: NMT Improvement Plan

Note: Only priority NMT links shown in the figure. The remaining length of NMT should be studied and taken up for development

4.4.1 Area Mobility Improvement Plan (AMIP)

The plan shall identify important mobility networks within the major economic areas of the city for improving mobility of pedestrian and vehicles. Integration of last mile services and public transportation is one of key component of AMIP. AMIP shall consist of removing bottlenecks / impediments to efficient mobility, measures for enhancing capacity and resolving safety issues. To begin with, following four major economic areas are suggested.

1. Majestic Area
2. Malleswaram Area
3. Indiranagar – HAL Area
4. Whitefield – ITPL Area

#### 4.4.2 Station Area Access Plan (SAAP)

Metro SAAP are proposed to reduce the requirement for commuters to bring their personal vehicle or use public transport for their commute to and from metro stations. For each station, area of 1 km radius will be covered under the SAAP to improve the road network to TenderSure specifications. It shall also assess the demand for park-and-ride, the last mile destinations (and distances), currently available last mile mode options etc. SAAP shall propose plans to integrate required last mile modes within the station area for passenger convenience. The SAAP shall also propose critical intervention areas to improve safety of pedestrians in station areas, identify bottleneck locations and suggest solutions to ease traffic movement. To begin with 4 terminal stations and 11 other stations in areas having high population density are proposed for implementing SAAP, and thereafter other stations are to be covered.

**Table 4-14: Metro SAAP**

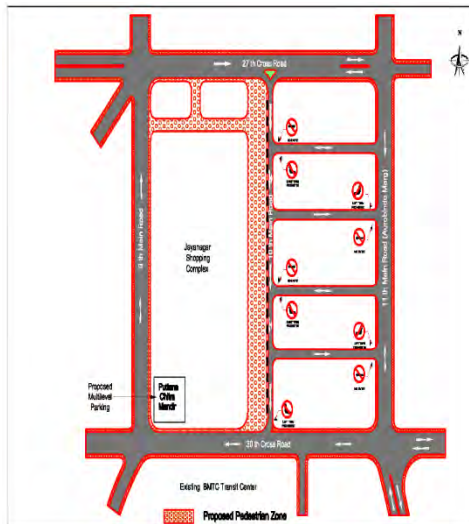

| Sl. No. | Metro Station           | Sl. No. | Metro Station         |
|---------|-------------------------|---------|-----------------------|
| 1.      | Baiyapannahalli Station | 2.      | Yellachanahalli       |
| 3.      | Nayandanahalli          | 4.      | Nagasandra            |
| 5.      | Sampige Mantri Square   | 6.      | Sriramapura           |
| 7.      | Rajajinagar             | 8.      | Mahakavi Kuvempu Road |
| 9.      | Mahalakshmi             | 10.     | Sandal Soap Factory   |
| 11.     | Yeshwantpur             | 12.     | Peenya                |
| 13.     | Peenya Industry         | 14.     | Dasarahalli           |

#### 4.4.3 Pedestrian Streets

Following streets having significantly large pedestrian traffic and commercial establishments are recommended to be declared as pedestrian only streets on Saturday, Sunday, other holidays and special days, as making them “for pedestrian only” streets is not practical as they also have large vehicular traffic on weekdays. Development of off-street parking near to those streets is also recommended. All these streets are near to existing or under-implementation metro network.

**Table 4-15: Pedestrian Streets**

| Sl. No. | Street  | Sl. No. | Street  |
|---------|---|---------|---|
| 1.      | Gandhi Bazar Main Road between KR Road and DVG Road | 2.      | 10 <sup>th</sup> Main Road adjacent to Jayanagar Shopping Complex |
| 3.      | Russel Market Road                                  | 4.      | Commercial Street from Kamraj Road to Juma Masjid Road            |
| 5.      | Brigade Road from MG Road to Residency Road         | 6.      | Church Street from ST. Marks Road to Brigade Road                 |
| 7.      | Between 7th Cross and 10th Cross Malleshwaram       | 8.      | Malleshwaram 8th Cross between Margosa Road and 18th Sampige Road |

**10<sup>th</sup> Main Jayanagar 4<sup>th</sup> Block**

**Gandhi Bazaar Main Road**

## 4.5 Multi-Modal Mobility Plan (MMMP)

Multi-Modal Mobility Plan proposed for the city envisages measures for facilitating convenience to transit from one mode to another in hassle-free and time efficient manner.

### 4.5.1 Multi-Modal Mobility Infrastructure

#### 4.5.1.1 Elevated Walkways connecting Public Transport Stations / Centers

Elevated walkways of 300 meter to 1500 meter are proposed at select locations to provide better connectivity between metro, railway and bus stations.

Table 4-16: Elevated Walkway

| Sl. No. | Walkway Location                             | Sl. No. | Walkway Location                                      |
|---------|--|---------|---|
| 1.      | Vijayanagar Metro to TTMC                    | 2.      | Banashankari Metro to TTMC                            |
| 3.      | Kengeri Metro to KSRTC Bus Stand             | 4.      | Kengeri Metro to New Kengeri Township                 |
| 5.      | Yeshwantpur Metro to East of Railway Station | 6.      | Yeshwantpur Metro to Railway Station                  |
| 7.      | Gyanbharati Metro to Railway Station         | 8.      | Sandal Soap Factory Metro to Yeshwantpur TTMC to IISc |
| 9.      | KR Puram Metro to North of Railway Station   | 10.     | Konappana Agrahara Metro to BMTc Station              |

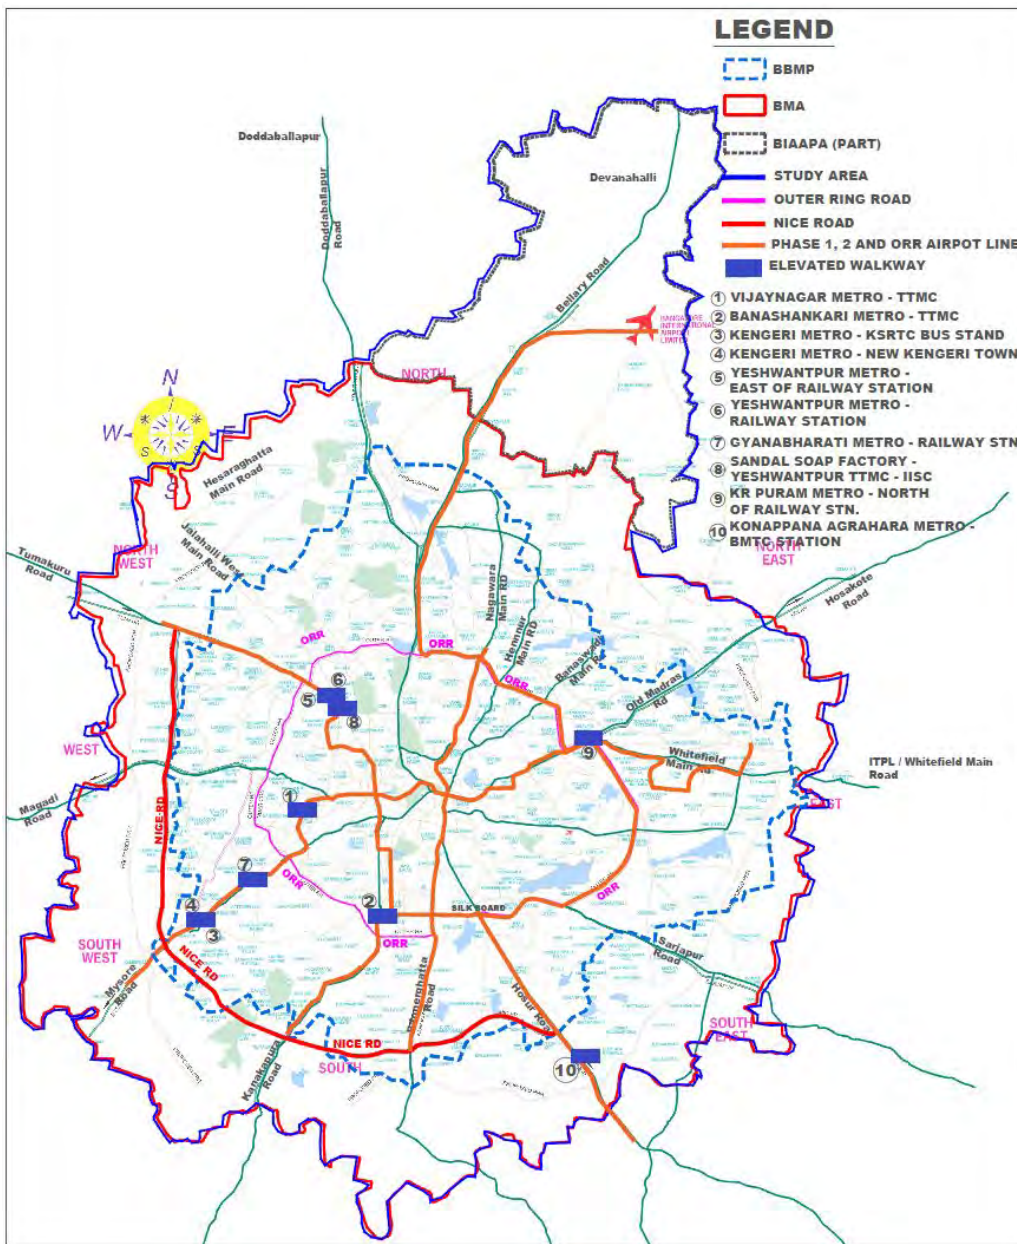

Figure 4-15: Elevated Walkway

### 4.5.1.2 Inter-modal Interchange Hubs

In all 32 intermodal interchange stations have been proposed where intersection of two or more public transit corridors is envisaged.

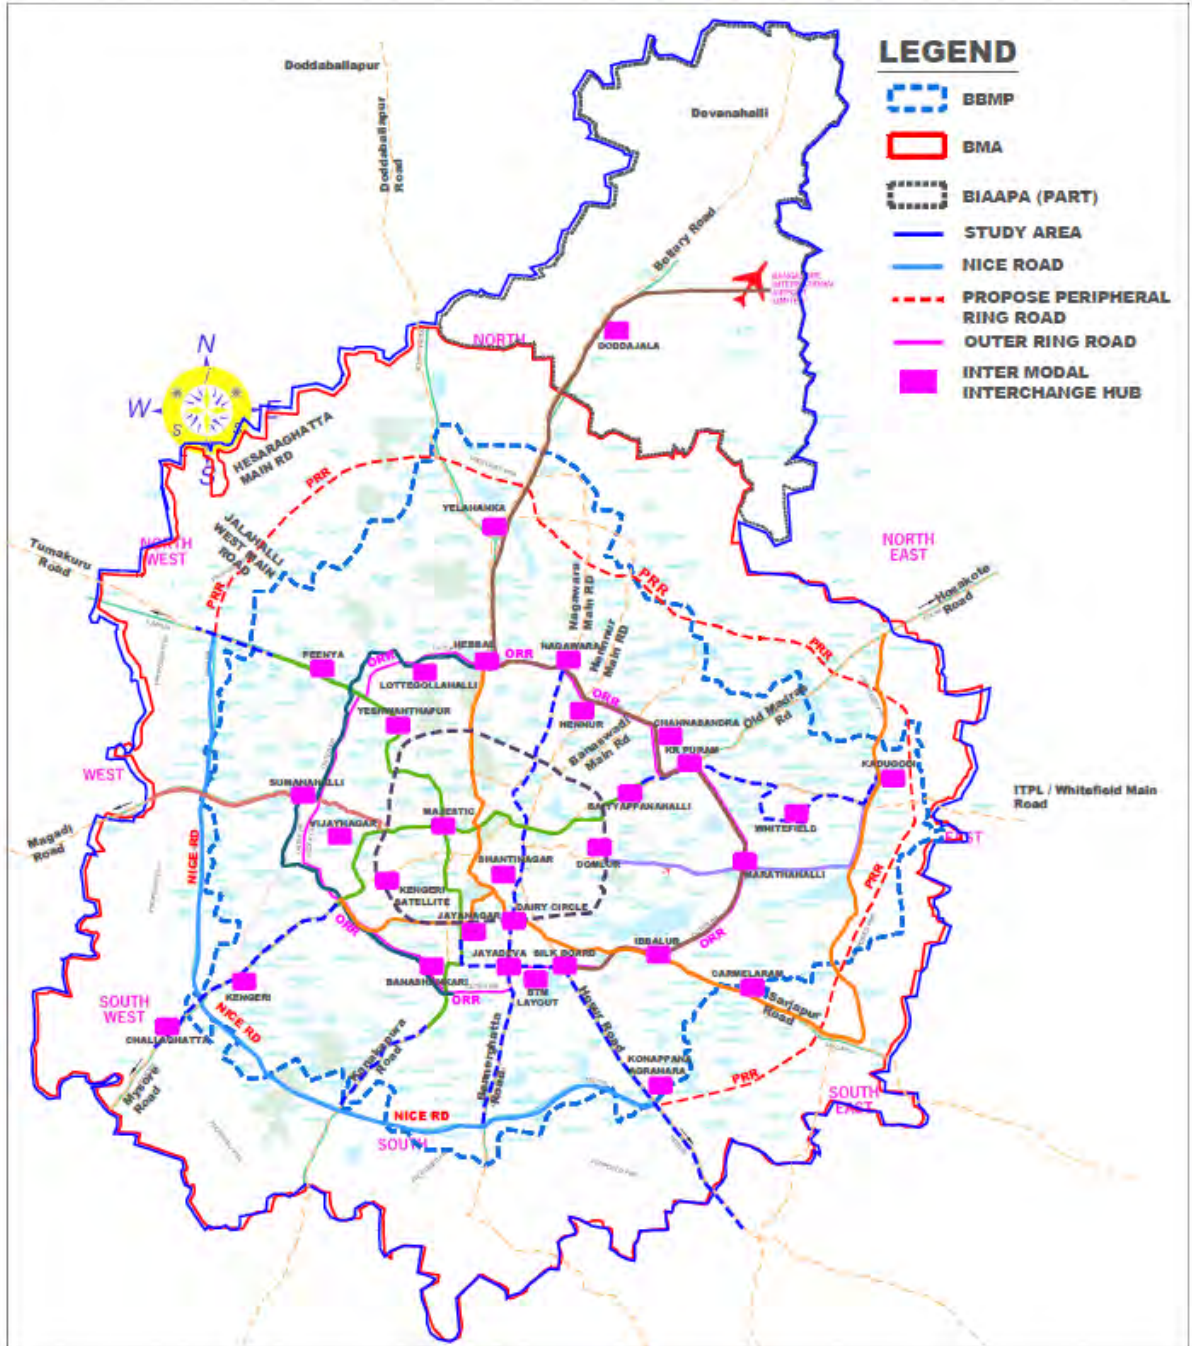

Figure 4-16: Inter - Modal Interchange Hubs

The infrastructure integration for interchanges includes i.e. wayfinding solutions (digital or physical like signages), crowd management strategies etc.

**Table 4-17: Inter Modal Interchange Hubs**

| Sl. No. | Description                        | Metro Interchange with:         |
|---------|------------------------------------|---------------------------------|
| 1       | Majestic                           | Metro / Suburban / BMTC / KSRTC |
| 2       | Nagawara                           | Metro                           |
| 3       | Ibbalur                            | Metro                           |
| 4       | Hebbal                             | Metro / Suburban / BMTC         |
| 5       | Sumanahalli Junction (Magadi Road) | Metro                           |
| 6       | Dairy Circle Junction              | Metro                           |
| 7       | Yelahanka                          | Metro / Suburban / BMTC         |
| 8       | Central Silk Board                 | Metro / BMTC                    |
| 9       | Jayadeva Interchange               | Metro                           |
| 10      | Peenya                             | KSRTC/BMTC                      |
| 11      | Marathahalli                       | Metro / BMTC                    |
| 12      | Challaghatta                       | Metro / KSRTC                   |
| 13      | Lottegollahalli Railway Stn.       | Suburban                        |
| 14      | Doddajala Railway Stn.             | Suburban                        |
| 15      | KR Puram Railway Stn.              | Suburban                        |
| 16      | Carmelaram Railway Stn.            | Suburban                        |
| 17      | Kadugodi Railway Stn.              | Suburban                        |
| 18      | Channasandra Railway Stn.          | Suburban                        |
| 19      | Baiyyappanahalli Railway Stn.      | Suburban                        |
| 20      | Whitefield TTMC                    | BMTC                            |
| 21      | Vijayanagar TTMC                   | BMTC                            |
| 22      | Banashankari TTMC                  | BMTC                            |
| 23      | Shantinagar TTMC                   | BMTC                            |
| 24      | Domlur TTMC                        | BMTC                            |
| 25      | Jayanagar TTMC                     | BMTC                            |
| 26      | Yeshwanthapura TTMC                | BMTC / Suburban/ KSRTC          |
| 27      | Hennur Bus Stand                   | BMTC                            |
| 28      | Konappana Agrahara                 | BMTC                            |
| 29      | BTM Bus stand                      | BMTC                            |
| 30      | Kengeri TTMC / Jnanabharati        | BMTC / Suburban                 |
| 31      | Kengeri Satellite Bus Terminus     | KSRTC / BMTC                    |
| 32      | Sigehalli                          | Metro / BMTC                    |

#### 4.5.2 Multi-Modal Mobility Fare System

National Common Mobility Card is proposed to be the primary mode of fare system of public transport operators, intermediate para-transit operators, and parking stations in the city. The eco-system for payment to the banks for charging the cards and for physical charging of the cards should be developed with lead to be taken by Bangalore Metro, BMTC under aegis of DULT.

#### 4.5.3 Inter-City Mobility

Contributing almost 36 per cent to Karnataka's GSDP, Bengaluru is the important economic centre in the state. Ease of connectivity of nearby cities to Bengaluru increases access to

livelihood opportunities for residents of nearby cities and enhances the potential for spreading economic growth. Ease of transportation of passengers and freight are key objectives for inter-city connectivity, which can be achieved by a mix of road and rail-based networks.

- i. Provide transit hubs towards the urban peripheries, to enable transfers from personal vehicles and inter-urban bus and train services to local transit services.
- ii. Deploy public-private partnerships for the development of quality highway infrastructure linking nearby cities to Bengaluru.
- iii. Improve rail linkages and schedules to nearby cities for daily commuting.

Figure 4-17: Inter-City Mobility Hubs

KSRTC provides the regional/ interstate connectivity from Bengaluru to other parts of the cities and vice versa, while BMTC provides intra-city services.

- a) A total of six intra and inter-state bus terminals are proposed on Tumkur Road, Mysore Road, Old Madras Road, Hosur Road, Bellary Road and Magadi Road so that intercity traffic will not get mixed with the city traffic. These terminals will cater to KSRTC as well as private busses plying from neighboring states.
- b) A total of 85 Depots/terminals are proposed for extended BMTC bus operations and 4 existing terminals are proposed for redevelopment.

## 4.6 Private Transport Management Plan

The explosive growth in registration of personal vehicles and the corresponding growth in the number of trips fulfilled using personal two-wheelers and cars, has led to negative consequences for congestion and environmental stress. Growing ownership rates of two-wheelers and cars is an indicator of the mode shift to personal transportation, as vehicle ownership is a highly significant factor that impacts mode choice. The imperative for more sustainable and efficient transport is to reduce the number of trips made by personal vehicles by shifting trips to public transport, shared mobility and NMT.

- i. Make reserved parking a pre-requisite for new vehicle registrations across the state to raise the bar for ownership and to ensure that vehicles do not take up on-street parking space at residential areas.
- ii. Apply parking requirements for existing vehicles, allowing owners two years' time to find reserved parking spaces for their vehicles, street parking regulations and charge for high demand zones.
- iii. Strengthen PUC checks and penalties for polluting vehicles and those emitting smoke; improve enforcement by installation of remote sensor-based PUC system.
- iv. Introduce reforms for medium term renewal of personal vehicle registrations, and link documentary requirements such as current address proof, vehicle insurance, PUC and vehicle fitness certificates, to the vehicle registration renewal.
- v. For safer driving behaviours and greater traffic discipline, enforce stricter norms for driving license achievement with more rigorous testing, and link traffic violations to drivers' licenses with appropriate penalties.
- vi. Promote regulatory, fiscal and pricing measures to influence usage of vehicles- these could include fuel surcharges, congestion fees, low emission zone fee, renewal fees, insurance premiums based on usage, etc.
- vii. Enable the availability of quality public transport services and NMT infrastructure, to provide credible alternatives to personal vehicle usage.
- viii. Promote greater integration of urban planning and transport planning, with preference for mixed-use land use planning and more walkable urban design.

## 4.7 Freight Movement Plan

Freight in urban areas today can be classified into two types- large-scale inter-city freight movements with linkages in the city and the growing number of intra-urban logistics and home

deliveries using commercial vans and two-wheelers, which contribute to traffic congestion and have higher negative impacts on pollution and emissions than private vehicles.

- i. Create a decentralized network and hierarchy of logistics and freight transit hubs, not only at the urban peripheries but also in core city areas.
- ii. High-volume freight deliveries and truck movements to market areas to be restricted to night-time or off-peak hours.
- iii. Impose tax on e-commerce delivery trips to mitigate the negative externalities caused by movements of delivery vans and two-wheelers, with higher taxes on same-day deliveries and other premium delivery methods that may lead to increased vehicle kilometers travelled.
- iv. Freight movements not meant for the city to be routed via the PRR or other bypass road networks to prevent entry of high-capacity vehicles into the city.

Freight logistic centers are proposed at locations close to intersections of PRR and NICE road with arterial roads of the city, namely, Bellary Road, Doddaballapur Road, Tumkur Road, Magadi Road, Mysore Road, Kanakapura Road, Hosur Road and Old Madras Road. Subsequently, if need arises, additional freight hub may be considered in BIAAPA limits.

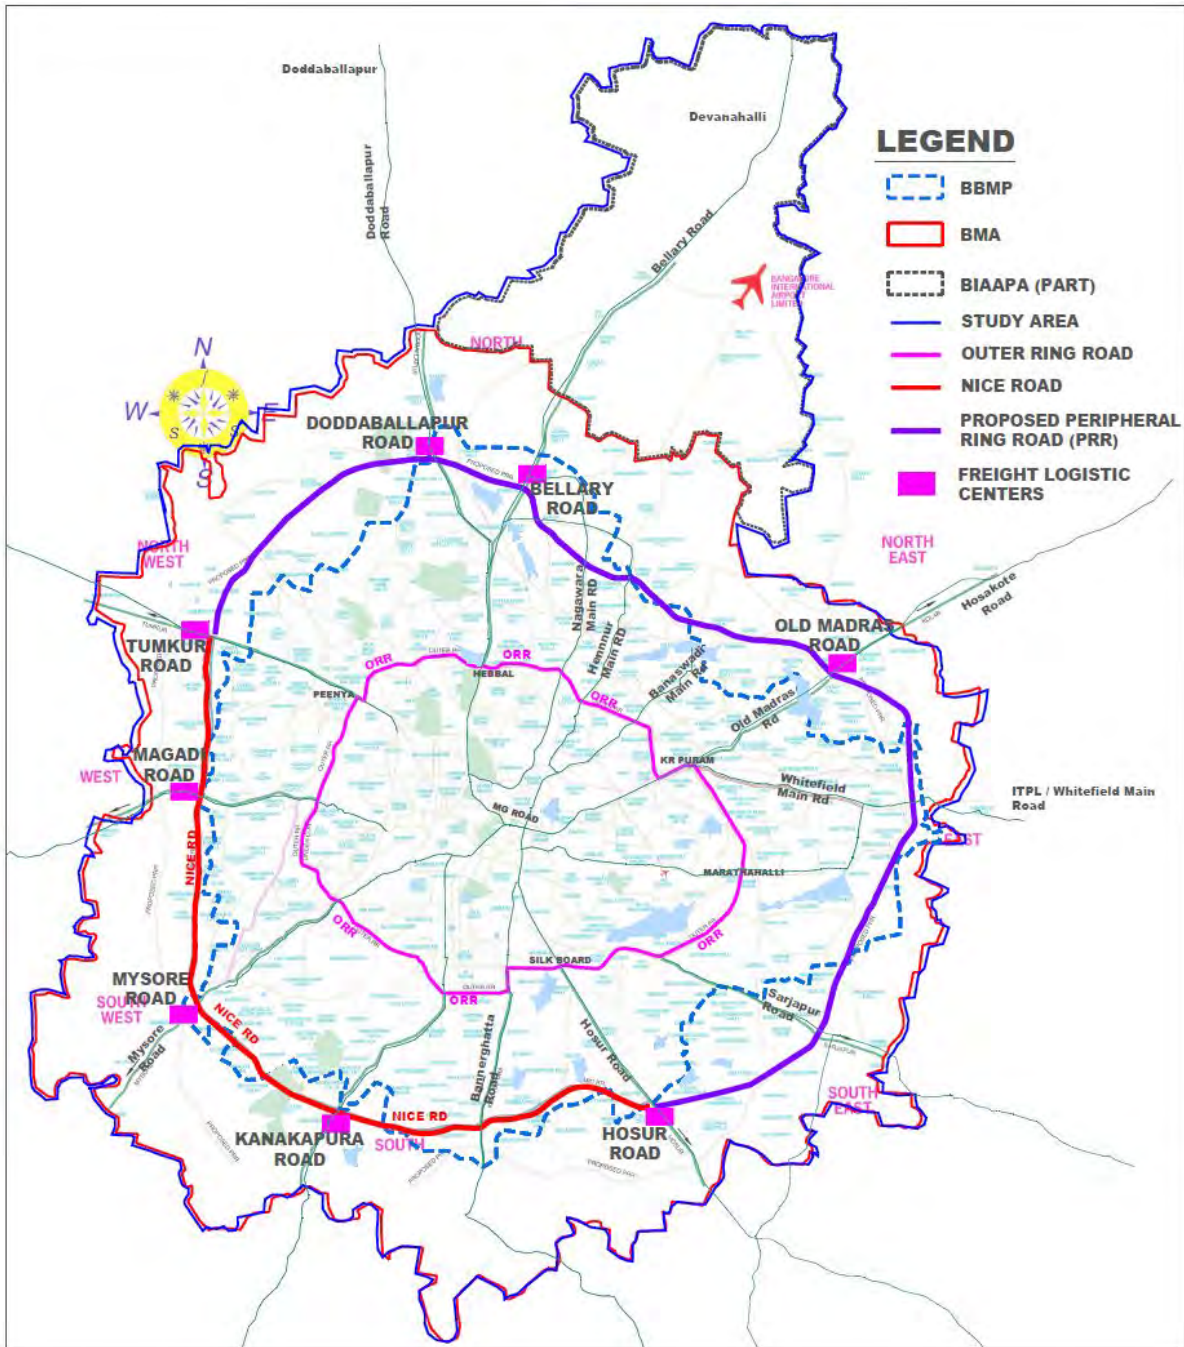

Figure 4-18: Freight Logistic Centres

#### 4.8 Technological Measures

Technological measures encompassing changes in vehicle design, fuel use, energy use, are proposed for better traffic management and reduction in CO<sub>2</sub> emissions. Various actions framed for the same are:

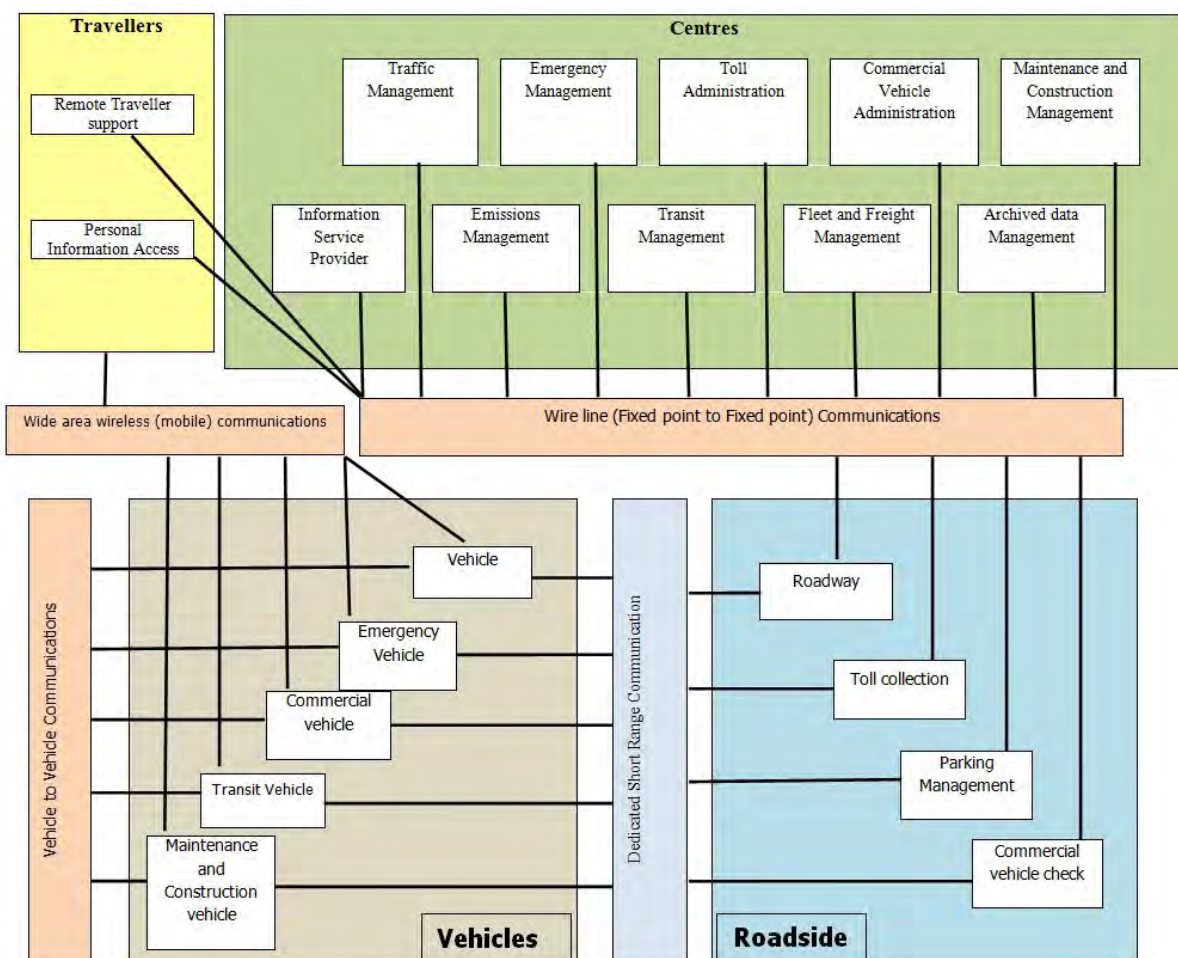

- a) Smart signalling at intersections
- b) Real time information systems for Public Transport

- c) Introduce integrated ticketing system
- d) Use of smart parking technologies
- e) Creation of infrastructure for transport data management

Technological improvements include advanced applications which, without embodying intelligence as such, aim to provide innovative services relating to different modes of transport and traffic management and enable various users to be better informed and make safer, more coordinated, and 'smarter' use of transport networks.

#### 4.8.1 Intelligent Transport Systems

ITS encompasses all modes of transportation- air, sea, road and rail and intersects various components of each mode- vehicles, infrastructure, communication and operational systems.

**Figure 4-19: Schematic Representation of ITS**

(Reference: Centre of Excellence in Urban Transport, IIT-M, Intelligent Transport Systems)

Intelligent Transport Systems will include:

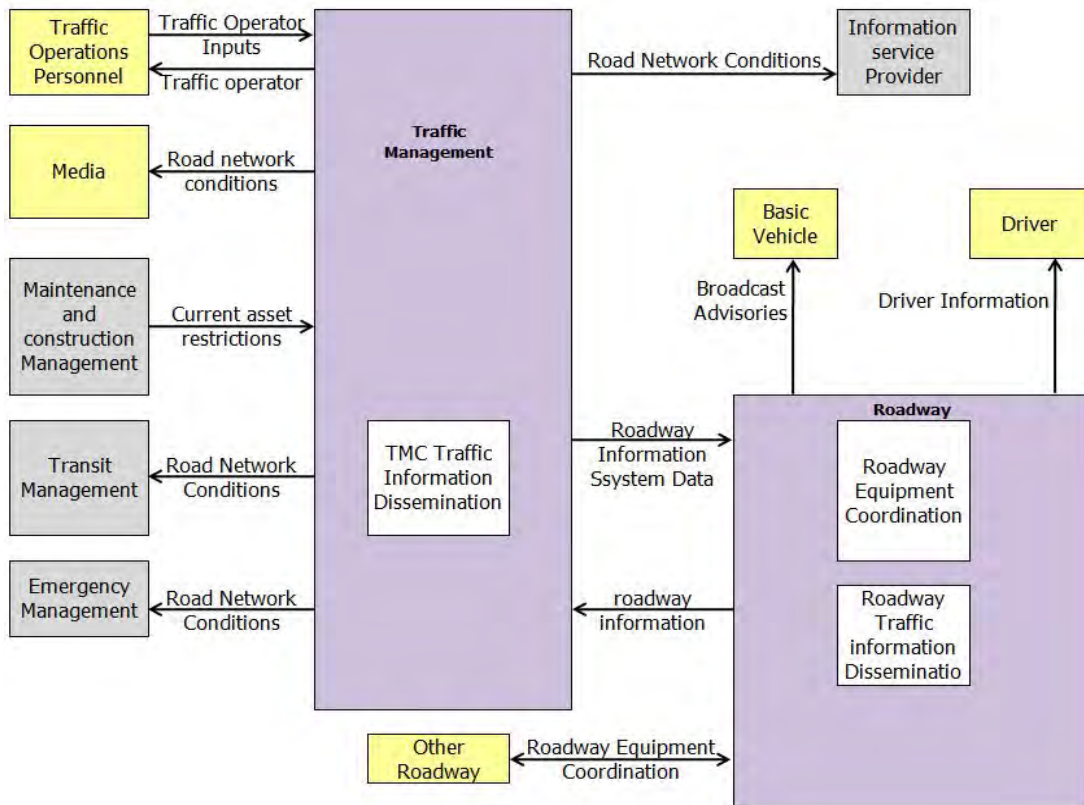

- a) **Advanced Traffic Management Systems (ATMS)** integrates various sub-systems (such as CCTV, vehicle detection, communications, variable message signs etc.) into a coherent single interface that provides real information on traffic status.

- b) **Advanced Traveller Information Systems (ATIS)** provides users of transportation systems both public and private mode users travel related information regarding routes, estimated travel times etc.
- c) **Commercial Vehicle Operations** for constant monitoring of heavy vehicles. It can be in the form of smart cards, weigh bridges etc.
- d) **Advanced Public Transportation Systems** to enhance efficiency of public transit systems through information systems, signal priorities, GPRS etc

**4.8.2 Traffic Management Centre**

The existing Traffic Control Center on Infantry Road should be integrated with the Integrated Command Control Centre (ICCC) being established under the Smart City Program to facilitate real-time traffic monitoring, dynamic message sign monitoring and control, incident monitoring, traffic camera monitoring and control, active traffic management (ATM), arterial management, traffic signal monitoring and control, automated warning systems, road weather information system (RWIS) monitoring, public transport information and real time route information.

**Figure 4-20: Schematic Representation of TMC**

**4.8.3 Smart Signalization**

Smart signalization at all major junctions in the city with conversion of all existing signals into smart signals with adaptive traffic signal controls should be taken up to reduce delay and queuing, efficient movement of pedestrians and cyclists, maximizing vehicle movement, reduce severity of crashes, and improve accessibility to pedestrians and side street traffic.

#### 4.8.4 Vehicle Technology

As a green initiative to move towards sustainable urban transport, technological transformation for public transport and IPT vehicles is suggested by gradually phasing out diesel vehicles to CNG or electric vehicles. In this initiative, BMTC would convert all its premium (A/C) bus services to electric and subsequently convert the non-A/C buses to electric in a phased manner. The State Government shall support the public transport operators to convert the bus depots to meet requirements of electric buses. The State Government shall also strive to create infrastructure for charging of electric vehicles at vantage points like parking lots, existing fuel stations to facilitate faster adoption of electric fleet among IPT operators.

#### 4.9 Travel Demand Management Plan

Travel demand management measures are proposed (excluding provision of major infrastructure) to modify travel decisions so that more desirable transport, social, economic and environmental objectives can be achieved, and the negative externalities can be minimized. The combination of TDM strategies and policies are expected to help in reducing travel demand or redistributing this demand in space or in time. The proposed TDM strategies are road space reallocation aiming to re-balance provision between private cars and other sustainable modes, road space rationing by restricting travel at certain times and places, car parking controls and pricing, parking strategies, flexi-time work schedules with employers to reduce congestion at peak times, workplace travel plans, introducing active trip reduction programs, and public education and awareness programs.

#### 4.10 Regulatory Measures

Regulations for urban transport need to be aligned with one another and designed to achieve system objectives of greater efficiency and sustainability. The regulatory framework must include the right mix of incentives and dis-incentives to influence commuter behaviour and the operations of public and private mobility providers. Permit specifications and number of permits for different mobility services, fare regulations, vehicle specifications for fuel consumption and emission levels, vehicle testing and maintenance standards, speed and other safety regulations, data sharing standards and integrated planning requirements- all comprise different tools available to the state regulator for providing access to safe and sustainable mobility for the maximum number of people.

- i. Parking rules and regulations set up entry barriers for vehicle ownership and usage, which in turn can support more sustainable mode choices provided that credible alternatives exist.
- ii. Regulatory reform is needed around personal vehicle registration, renewal, inspection and maintenance to ensure that emitting vehicles are removed from the roads, road safety is improved, and the costs of vehicle use are proportionately levied on owners.
- iii. Regulatory reform for public transport should focus on permitting public-private partnerships and contracting of private bus services for capacity augmentation.
- iv. Explore the potential for fare regulations to promote integrated fares between public transport services and enable payment integration across all mobility services using the common mobility card.

- v. Mandate data integration of operations of different mobility services through a City Mobility Stack, which helps commuters by providing integrated information on service availability and options and helps service providers and planning agencies to use data analytics for operational decision making.
- vi. Necessitate integrated planning for infrastructure projects, between different transport networks as well as inter-sectoral integration between urban and transport planning.
- vii. Mandate the inclusion of pedestrian footpaths, bicycle lanes and bus lanes in all new road construction.
- viii. Augment strength and deployment of traffic police personnel as necessary, for traffic management and enforcement of rules and regulations.
- ix. Promote the greater use of technology for regulatory enforcement, using integrated databases for tracking and linking violations with driving licenses, and data capture tools such as video analytics, sensors and other solutions for automated enforcement.
- x. Regulate standards for road design, construction and maintenance.
- xi. Take up town planning schemes for orderly development of green-field and brown-field areas.

#### 4.10.1 Levy on usage of road resource

Even as the road network is improved and expanded, the costs of road usage should be applied to users, to ensure efficient usage and to dis-incentivize any travel demand induced due to the availability of good mobility networks. At the same time, strict enforcement of traffic rules is necessary for safer roads for all users.

- i. Regulatory and pricing measures such as dynamic congestion fees and parking fees to be applied in areas experiencing high traffic congestion and peak volumes.
- ii. Robust traffic management to be instituted and penalties levied, to encourage adherence to traffic rules and lane discipline; violations to be linked with driving license and vehicle registration, with suspension of license of repeat offenders.

#### 4.10.2 Fare regulations for urban transport

Fare-setting for public transport systems and the application of fare structures for IPT and other shared mobility services are sensitive and complex tasks. Fares must strike a balance between commuters' interests of affordability and service quality, the financial viability of public transport operators, the inclusion of costs of negative externalities to be borne by users of different transport services, and ensuring adequate market competitiveness for mobility companies. Currently, there is no integrated mechanism for a scientific and independent process, though fare regulations exist for public transport, IPT and transport aggregators in the state. It is hence suggested that an independent authority, potentially under the aegis of the BMLTA, may be constituted to determine and regulate fares of transport services in the city.

#### 4.10.3 Data-sharing standards for urban transport

Urban transport systems are seeing a profusion of data being generated that could significantly improve evidence-based urban and transport planning, and enable unobtrusive enforcement of regulations. Data sets include trip data of modern transport aggregator services and public

transport services held with the respective companies or transit agencies; license, vehicle registration and permits data held with the Transport Department; road network, parking, land-use and plot level data held with the BBMP and BDA; traffic violations and accidents data with the BTP. Bringing together these data sets currently held in silos by various public and private agencies, as well as opening up anonymized transport data to the public, can promote integrated mobility planning as well as innovation for the development of better commuter services.

The following principles may guide the data-sharing framework:

- i. All public transport vehicles and rail-sets, IPT vehicles and four-wheel private vehicles should be obligated to telemetry-based tracking as they use the public road space.
- ii. The locational and occupancy data about public transport and IPT vehicles should be placed in the public domain on an open platform for use by different transport agencies and IT-based transport support service companies.
- iii. The data of the commuters must be non-personal and anonymized to protect all individuals.
- iv. The data regarding drivers of vehicles on the roads should be available to regulatory agencies.

It is recommended that BMLTA may be strengthened with statutory powers and exclusively entrusted to oversee the set-up of the City Mobility Stack, and to establish a trusted legal and governance framework for data collection, sharing, and use of mobility data, which protects the interests of residents, commuters and transport operators. This framework should lay down and enable enforcement of standards for collection and sharing of necessary data generated by IPT and public transport services, be it for use by specific planning authorities or for sharing as 'open data'. The framework should also oversee the usage of the data for efficient and integrated mobility planning. Owing to concerns of privacy and data protection and security, the data collected should be protected by a robust privacy framework which would ensure that the collected data is anonymized and safely stored to prevent any misuse.

## 4.11 Governance Measures

Fragmented governance of urban transport sector has led to inequities of investment and competing interests- for example, the provision of metro services, suburban rail services and public bus services should be complementary to one another and collaborative rather than competing, which may not be the case if they are governed by wholly independent agencies. Moreover, transport demand is generated by the locations of homes and jobs in the urban planning of the city, whereas transport supply is provided through transport planning- it is essential to integrate urban and transport planning to better regulate the growth of transport demand and design more pedestrian friendly and transit-oriented cities.

- i. Strengthen existing BMLTA committee as an authority with representation from all transit agencies, urban planning bodies and empower the authority with adequate fiscal and regulatory power to achieve objectives of integrated urban transport planning and development.

- ii. Enable the integration of the city bus services with the rail-based metro and suburban train networks, for seamless transit connectivity.
- iii. Build capacity for data-driven decision making and integrated planning among transit agencies and the BMLTA
- iv. Mechanism for effective enforcement of building bye-laws with public crowd sourcing of monitoring and prohibitively high penalties should be put-in place to create the demand for TDR and premium FAR.

## 4.12 Fiscal Measures

Fiscal policies work in complement with regulations and standards to minimize the negative externalities of transportation. Equally important, they generate revenues for investment in transportation. The objective of fiscal measures and user fees should be to incentivize sustainable choices and align user costs to reflect the costs of their mode choice. In Bengaluru, where the mode share of public transit is eroding and the shift to personal vehicles accelerating, a comprehensive policy of fiscal and pricing measures can serve to incentivize investment in cleaner vehicles, penalize emitters and polluters, induce more sustainable mode choices for more numbers of trips, and reduce the number of vehicle kilometres driven. As such, comprehensive fiscal reform combined with a diverse, multi-modal transport system can balance individual commuter well-being with that of the city.

- i. Explicitly link motor vehicle tax for new vehicle purchases to fuel efficiency and emissions standards, with additional fees for bigger cars and SUVs and exemptions for cleaner energy vehicles including hybrids and EVs.
- ii. Introduce dynamic pricing instruments to capture and charge vehicle usage-
  - a. Fuel taxes for each litre of fuel consumed
  - b. Insurance premiums based on vehicle usage with higher premiums for higher usage
  - c. Congestion fees and road pricing for each instance of road usage
  - d. Parking fees that are time-based and demand-based
- iii. Institute annual renewal fees for vehicle registration and link them with the pollution emission and fuel efficiency of the vehicle, and ensure that strict action is taken against polluting vehicles.
- iv. Institute friendlier tax environment on inputs for public transport operators and determine the fare from twin perspectives of affordability for commuters and financial sustainability for the operators.
- v. Provide support for capacity augmentation.
- vi. Reform the taxation of motor vehicles to become a function of road usage efficiency; public transport vehicles to have the lowest tax rate, and IPT to be taxed at higher rates based on the vehicle capacity and road usage efficiency and duration. Explore possibility of lower taxation for vehicles registered for use on weekends only.

- vii. Deploy transit-oriented development along all mass transit corridors to generate revenues for funding infrastructure growth.

Revenues generated from fiscal policies and pricing instruments should be used for investment in cleaner and more efficient transportation systems. In Bengaluru, investments can be made in upgrading and expanding public transport systems and constructing continuous and accessible NMT infrastructure.

## 4.13 Action Plan and Budget Plan

The mapping of the strategic framework to the Action Plan has been detailed in the matrix below.

**Table 4-18: Strategy-Action Plan Matrix**

| Action Plan                           | Strategy 1  | Strategy 2   | Strategy 3                           | Strategy 4                           | Strategy 5                                | Strategy 6                              | Strategy 7   | Strategy 8   | Strategy 9  | Strategy 10  |
|---------------------------------------|---|--|--------------------------------------|--------------------------------------|---|---|--|--|---|--|
|                                       | Expand reach and augment capacity of public transport systems | Improve operational efficiency of public transport systems | Promote multi-modal mobility options | Promote Transit Oriented Development | Improve efficiency of road infrastructure | Augment capacity of road infrastructure | Make commuters bear full cost of externalities of mobility modes | Influence mobility choice through regulator, fiscal and pricing measures | Promoting use of electric and cleaner fuel vehicles | Establish mechanism for planning, capacity building and accountability |
| Integrated Land Use and Mobility Plan | ✓   |  | ✓                                    | ✓                                    |   |   |  |  |   |  |
| Public Transport Improvement Plan     | ✓   | ✓  |                                      | ✓                                    |   | ✓                                       |  |  |   |  |
| Road Network Development Plan         | ✓   | ✓  |                                      |                                      | ✓   | ✓                                       |  |  |   |  |
| Non-Motorized Transport Plan          |   |  | ✓                                    | ✓                                    |   |   |  |  |   |  |
| Multi-Modal Mobility Plan             | ✓   | ✓  | ✓                                    | ✓                                    |   |   |  |  |   |  |
| Private Transport Management          |   |  |                                      | ✓                                    | ✓   |   | ✓  |  |   |  |

|                                      | Strategy 1  | Strategy 2   | Strategy 3                           | Strategy 4                           | Strategy 5                                | Strategy 6                              | Strategy 7   | Strategy 8   | Strategy 9  | Strategy 10  |
|--------------------------------------|---|--|--------------------------------------|--------------------------------------|---|---|--|--|---|--|
| <b>Action Plan</b>                   | Expand reach and augment capacity of public transport systems | Improve operational efficiency of public transport systems | Promote multi-modal mobility options | Promote Transit Oriented Development | Improve efficiency of road infrastructure | Augment capacity of road infrastructure | Make commuters bear full cost of externalities of mobility modes | Influence mobility choice through regulator, fiscal and pricing measures | Promoting use of electric and cleaner fuel vehicles | Establish mechanism for planning, capacity building and accountability |
| <b>Plan</b>                          |   |  |                                      |                                      |   |   |  |  |   |  |
| <b>Freight Movement Plan</b>         |   |  |                                      | ✓                                    | ✓   |   |  |  |   |  |
| <b>Technological Measures</b>        |   | ✓  | ✓                                    |                                      | ✓   |   |  |  | ✓   |  |
| <b>Travel Demand Management Plan</b> |   | ✓  |                                      |                                      | ✓   |   | ✓  | ✓  |   |  |
| <b>Regulatory Measures</b>           |   |  | ✓                                    | ✓                                    |   |   | ✓  | ✓  |   | ✓  |
| <b>Governance Measures</b>           |   |  |                                      |                                      |   |   |  | ✓  |   | ✓  |
| <b>Fiscal Measures</b>               | ✓   |  |                                      | ✓                                    |   | ✓                                       | ✓  | ✓  | ✓   | ✓  |

Each agency will be required to delineate its action plan, prioritize the projects with multi-year phasing, prepare cost estimates, identify funding sources including its own budget and supplementary funding from Bengaluru Urban Transport Fund (BUTF), decided mode of implementation including public-private partnerships, and bring its rolling three-year plans before BMLTA for appraisal and appropriate recommendations to the competent authority for approval.

#### 4.14 Monitoring and Evaluation Plan

For each project brought before BMLTA by the concerned agency as part of its multi-year rolling plan, the agency may be asked to prepare a design and monitoring framework (DMF). The format and the guidance note for the DMF are placed as **Annexure 4.2**. For continuing access to supplementary funding from the BUTF, submission of the project specific DMF at the time of seeking appraisal and thereafter submission of the evaluation of the implemented projects with reference to the DMF while seeking approval for the successive rolling plan may be made mandatory.

#### 4.15 Engagement of Stakeholders including Citizens

In preparation of the CMP, the stakeholders within the government fold were consulted extensively. The feedback received from the external stakeholders including citizens on the draft TOD Policy has guided preparation of the CMP. Further, the interactions held with external stakeholders specially IPT operators and aggregators and research institutes in preparation of the report on “efficient and sustainable transport for Bengaluru city” provided important inputs for formulation of the CMP.

The draft CMP was hosted on DULT and BMRC Website from 06.12.2019 to 20.01.2020 for public comments and suggestions. Almost 3500 comments / suggestions were received. Focus group meetings were also held with citizen and expert groups. All relevant comments / suggestions have been incorporated in final CMP appropriately, and the final CMP will be submitted to BMLTA and Government for approval.

#### 4.16 Mobility Improvement Measures and NUTP Objectives

The table below summarizes the proposals of CMP with reference to the NUTP objectives.

**Table 4-19: NUTP Objectives and CMP Proposals**

| NUTP Objectives  | CMP Proposals  |
|--|--|
| Encourage integrated land use and transport planning to minimize travel distance and improve access to livelihoods, education, and other social needs. | The Transit Oriented Development (ToD) has been proposed, which envisages Bengaluru becoming a public transport oriented city that is compact, people friendly, environment friendly and support economic growth while offering a good quality of life |
| Bring about equitable allocation of road space with people, rather than vehicles, as its main focus  | The CMP, proposes the corridor improvement plan and junction improvements with specific focus on improving facilities for bus services and pedestrians.  |

| NUTP Objectives   | CMP Proposals   |
|---|---|
| Encourage greater use of public transport and non-motorized modes   | The CMP targets to move 70% of people on mass transit rather than privately owned vehicles. The CMP envisages 700 km of public transport network within BMA on dedicated rails, roads, traction-guidance, in addition to augmentation of public bus transport services. The CMP also proposes NMT plan comprising walking and bicycling through area mobility improvement plan (AMIP), Station Area Access Plan (SAAP) and pedestrian streets.  |
| Enable the establishment of quality focused multi-modal public transport systems that are well integrated, providing seamless travel across modes                                     | Multi-Modal Mobility Plan has been proposed for the city envisages measures for facilitating convenience to transit from one mode to another in hassle-free and time efficient manner. The proposals to this extent includes elevated walkways connecting public transport stations, intermodal transport hubs, multimodal mobility fare system, and inter-city mobility.   |
| Establish effective regulatory and enforcement mechanisms that allow a level playing field for all operators of transport services and enhanced safety for the transport system users | The CMP also proposes the regulatory measures for urban transport which include parking rules and regulations, fare regulations, levy on usage of road transport, data sharing standards, permit specifications and number of permits for different mobility services, vehicular specifications for fuel consumption and emission levels, vehicle testing and maintenance standards, use of technology for regulatory enforcement, mandate the inclusion of pedestrian footpaths, bicycle lanes and bus lanes in new road construction etc. |
| Establishing institutional mechanisms for enhanced coordination in the planning and management of transport systems   | The CMP proposes to operationalize UMTA (BMLTA-Bengaluru Metropolitan Land Transport Authority) with representation from all transit agencies, urban planning bodies and equip the authority with adequate fiscal and regulatory power to achieve objectives of integrated urban transport planning and development.  |
| Introducing Intelligent Transport Systems for traffic management  | The CMP proposes technical measures including Intelligent Transport Systems. The ITS proposals include advanced traffic management systems (ATMS), advanced traveller information systems (ATIS), commercial vehicle operations and advanced public transport systems.  |
| Addressing concerns of road safety and trauma response  | The CMP proposes the measures for providing access to safe mobility by mandatory inclusion of pedestrian footpaths in new roads, design improvement, amend the On-Demand  |

| NUTP Objectives   | CMP Proposals  |
|---|--|
|   | Transportation Technologies Aggregator (ODTTA) Rules to strengthen road and passenger safety requirements, encourage safer driving behavior, etc.  |
| Reducing pollution levels through changes in traveling practices, better enforcement, stricter norms, technological improvements, etc.  | To reduce the pollution levels, CMP proposes the promotion of zero emission clean-tech vehicular fleet, institute annual renewal fees for vehicle registration and link them with the pollution emission, phasing out diesel vehicles to CNG or electric vehicles etc. |
| Building capacity (institutional and manpower) to plan for sustainable urban transport and establishing knowledge management system that would service the needs of all urban transport professionals, such as planners, researchers, teachers, students, etc | The CMP also proposes to establish mechanism for planning, capacity building and accountability through regulatory measures.   |
| Promoting the use of cleaner technologies   | One of strategies of the CMP is to promote use of electric and cleaner fuel vehicles. CMP proposed adoption of electric fleet for all public city bus services and electric/CNG fleet for auto rickshaw.   |
| Raising finances, through innovative mechanisms that tap land as a resource, for investments in urban transport infrastructure  | The CMP proposes innovative financing mechanism as one of options for investment in proposed projects.   |
| Associating the private sector in activities where their strengths can be beneficially tapped   | The CMP proposes the private sector participation to carry out specific projects.  |

#### 4.17 Impact of Proposed Measures on Service Level Benchmark

##### 4.17.1 Public Transport Facilities

- PRESENCE OF ORGANIZED PUBLIC TRANSPORT SYSTEM IN URBAN AREA (%)

Bengaluru's public transportation system is operated and maintained by Bengaluru Metropolitan Transport Services (BMTc). In future, the city will have 14650 buses.

A = Total Number of Buses in the City operating – 15134 buses

B = Total Number of operating Buses under the ownership of STU/SPV – 15134 buses

Presence of Organized Public Transport System in Urban Area (%) = (B/A)\*100

= 100 %, therefore corresponds to LoS 1

- EXTENT OF SUPPLY AVAILABILITY OF PUBLIC TRANSPORT (AVAILABILITY OF PUBLIC TRANSPORT / 1000 POPULATION)

The Estimated Population of study area for the year 2031 will be 216.13 lakhs

A = Total Number of Buses in the City will be – 15134 buses

B = Total Population of the Study area – 216.13 lakhs.

Availability of Public Transport / 1000 Population =  $A / (B/1000) = 0.7$ , Therefore corresponds to LoS = 1

- **AVERAGE WAITING TIME FOR PUBLIC TRANSPORT USERS (MINS)**

The average headway for each bus route will be about 20 minutes.

Therefore, the average waiting time will be half the headway i.e. 10 minutes, therefore corresponds to LoS 3.

**The overall LoS of Public Transport Facilities is obtained by summing up the LoS of individual parameters, Overall Level of Service of Public Transport facilities in Bengaluru. Thus overall LoS corresponds to '1'.**

#### 4.17.2 Travel Speed (Motorized and Mass Transit) along Major Corridors

- **AVERAGE TRAVEL SPEED OF PERSONAL VEHICLES (KMPH)**

The average journey speed for major corridors for the private vehicles likely to increase to = 27 Kmph. Therefore, corresponds to LoS 2.

- **AVERAGE TRAVEL SPEED OF PUBLIC TRANSPORT (KMPH)**

The average journey speed for major corridors for the public transport likely to increase = 25 Kmph. Therefore, corresponds to LoS 1.

Overall Level of Service of Travel Speed facilities city wide =  $2+1 = 3(\text{score}) = \text{LOS } 2$

**The overall LOS =  $2+1=3(\text{score})$  this corresponds to LoS 2**

#### 4.17.3 Availability of Parking Spaces

This indicator represents the availability of paid on-street parking spaces for all vehicles in the Bengaluru. Paid on-street parking facility is not yet introduced in Bengaluru city except in some off-street locations like Bus stands, railway stations and other commercial complexes. In some places like Malls parking is maintained by private people.

As the percentage is negligible it is considered as <25 %. Therefore LoS 4.

The ratio of maximum and minimum parking fee is >4 for Bengaluru city. Therefore, LoS 1.

**Overall score:  $4+1 = 5$  This corresponds to LoS 3.**

#### 4.17.4 Road Safety

Fatality rate per lakh population

Fatality Rate per Lakh of Population (%)

A = Total number of likely fatalities within city limits will be = 350 (in nos.)

B = Population of the LPA in 2031 year will be 216.13 (Estimated) (in Lakhs) Fatality rate per 100000 Population (ratio)

$$= (A)/(B/100000)$$

= 1.67 **This corresponds to LOS 1.**

#### 4.17.5 Pollution Levels

The indicator indicates the level of air pollutants in the city i.e., average level of pollution in urban areas. The indicator to calculate the pollution level is Mean Concentration Range.

The pollution data that needs to be collected includes:

Sulphur Dioxide (SO<sub>2</sub>)

Oxides of Nitrogen

Suspended Particle matter (SPM)

RSPM (Size less than 10 microns)

The level of service for the pollutants is divided into four categories i.e., low, moderate, high and critical. The level of service for each of the above parameters is determined using the table below as recommended by MoUD /MoHUA

For Bengaluru city, the pollution levels will get reduced in future as most of the buses and private vehicles will be either electrified and CNG, the pollution level will be as shown below

Oxides of Sulphur: 1, this corresponds to LoS 1

Oxides of Nitrogen: 3, this corresponds to LoS 1

SPM: 85, this corresponds to LoS 1

RSPM (Size less than 10 microns): 35, This corresponds to LoS 1

**Overall level of service of pollution city wide = LoS 1+ LoS 2+ LoS 3 + LoS 4 = 1+1+1+1= 4, this corresponds to LoS 1.**

#### 4.17.6 Integrated Land Use Transport System

- POPULATION DENSITY – GROSS (PERSONS/DEVELOPED AREA IN HECTARE)

A = Area (in Hectare) of study area= 1521.85 hectares

B = Population of the year (2031) will be = 216.13 lakhs  
Population density (No.) = B/A  
= 2,16,13,499 /1521.85 = 142.02.

**Therefore, corresponds to LoS 3.**

#### 4.17.7 Sustainability of Public Transport

- EXTENT OF NON FARE REVENUE (%)

A = Revenue collections per annum from non-fare related sources will be (i.e. excluding tariff box collections) - 550 crore

B = Total revenue per annum from all the sources i.e. majorly fare 100%  
Extent of non-fare revenue (%) = 7210 crores

A/B\*100= 7.5 %, Therefore LoS 4

STAFF /BUS RATIO

A = Total staff of bus operation and maintenance – > 65000

B = Total number of buses – 15134 (in Number)

Staff / Bus Ratio (ratio) = A/B = 4.3, Therefore LoS 1

**Overall score: 4 + 1 = 5 this corresponds to overall LoS 2.**

The summary of the LOS Calculated for the study area is presented in Table below

**Table 4-20: Summary of Service Level Bench Mark**

| Description   | LoS | Remarks  |
|---|-----|--|
| Public Transport Facilities                                     | 1** | The City has a good public transport system which is wide spread and easily available to the citizens. The system provided is comfortable.   |
| Non Motorised Transport (NMT) facilities                        | 2   | The city has NMT facilities which may need some improvements in terms of encroachments, parking facilities at interchanges etc as some parts of the city are not served buy it. The system provided is comfortable and sustainable.    |
| Travel speed (Motorized and Mass Transit) along major corridors | 2   | Small increase in flow may cause substantial increases in approach delay and hence, decrease in arterial speed.  |
| Parking spaces  | 3   | Paid parking spaces provided in the city need to be improved upon and to cater to the demand some differential parking rates for the CBD have been adopted. The city authorities need to imitative considerable improvements measures. |
| Road Safety   | 1   | Level of Fatality rate in a city is very low.  |
| Pollution levels  | 1   | Level of pollution in a city is very low.  |
| Sustainability of Public Transport                              | 2   | The public transport of a city is financially sustainable but needs some improvements  |

**NOTE\*\*-** This is based only on Indices provided by the guidelines restricting itself to buses against population with no other parameter considered, such as road infrastructure, operating speeds of buses, availability of space for bus stops, buses that are non-operational on the day, route rationalization, etc.

## 5 IMPLEMENTATION PLAN

In Chapter 4, twelve theme plans were described to achieve the desired mobility scenario in the planning area. In this Chapter, the plans are phased across time horizon for the purpose of implementation of these plans based on the needs of the city and considering constraints in availability of resources for implementation of CMP. The projects are also categorized as short, medium and long term on the basis of the time taken from initiation to commissioning of these projects. Indicative cost for implementation of the CMP in a phased manner is also presented in this Chapter. Finally, the Chapter identifies potential funding sources and mode of implementation (EPC or PPP), monitoring mechanisms for successful implementation of programs and institutional framework for required for implementation of CMP.

The implementation of the Plan should be on best effort basis, subject to limitations of the limited fiscal resources to be complemented by internal and extra-budgetary resources of relevant municipal and planning body (BBMP, BDA) and parastatal bodies (BWSSB, BESCO, BMRCL, BMTCL) and through appropriate public-private partnership and innovative measures of new levies aimed at value capture finances as well as mitigating demand for private source revenues.

### 5.1 Phasing of Implementation Plan

The range of projects under the twelve theme plans can take different duration for implementing the projects, and hence time taken to realize the benefits of implementing them. In this context, the projects have been classified into short term, medium term and long term based on the following definition.

- Short term projects: projects that take 0-2 years for commissioning
- Medium term projects: projects that take 3-5 years for commissioning
- Long term projects: projects that take more than 5 years for commissioning

**Table 5-1: Classification of Short-term, Medium-term & Long-term projects**

| CMP Plans                                    | List of Projects   |  |  |
|--|--|--|--|
|  | Short-term Projects  | Medium-term projects   | Long-term projects   |
| <i>Integrated Land Use and Mobility Plan</i> |  |  | <ul style="list-style-type: none"> <li>▪ Transit Oriented Development</li> </ul> |
| <i>Public Transport Improvement Plan</i>     | <ul style="list-style-type: none"> <li>▪ Bus fleet augmentation</li> </ul> | <ul style="list-style-type: none"> <li>▪ Suburban Rail on existing tracks</li> </ul> | <ul style="list-style-type: none"> <li>▪ Metro Rail</li> </ul>                   |

| CMP Plans                                | List of Projects  |  |   |
|--|---|--|---|
|  | Short-term Projects   | Medium-term projects   | Long-term projects  |
|  | <ul style="list-style-type: none"> <li>▪ Bus priority corridors</li> </ul>  | <ul style="list-style-type: none"> <li>▪ BRTS/Metrolite</li> <li>▪ Bus depots/terminals</li> </ul>   | <ul style="list-style-type: none"> <li>▪ Dedicated Suburban Rail</li> </ul>   |
| <b>Road Network Development Plan</b>     | <ul style="list-style-type: none"> <li>▪ Junction improvements</li> <li>▪ Foot over bridges/walkways</li> <li>▪ Capacity augmentation of major junctions</li> </ul> | <ul style="list-style-type: none"> <li>▪ Corridor improvements</li> <li>▪ Parking infrastructure</li> </ul>  | <ul style="list-style-type: none"> <li>▪ Peripheral ring road</li> <li>▪ Road widening</li> <li>▪ Elevated corridors</li> <li>▪ Development of missing links</li> </ul> |
| <b>Non-Motorized Transport Plan</b>      | <ul style="list-style-type: none"> <li>▪ Public bicycle sharing</li> </ul>  | <ul style="list-style-type: none"> <li>▪ Footpath (re) development</li> <li>▪ Cycle track development</li> <li>▪ Pedestrian only streets</li> </ul>                                    |   |
| <b>Multi-Modal Mobility Plan</b>         | <ul style="list-style-type: none"> <li>▪ Elevated walkways connecting public transport stations</li> </ul>  | <ul style="list-style-type: none"> <li>▪ Intermodal transit hubs</li> <li>▪ Multi-modal mobility fare system</li> </ul>  |   |
| <b>Private Transport Management Plan</b> | <ul style="list-style-type: none"> <li>▪ Insurance premium based on usage</li> <li>▪ Proof of parking for vehicle ownership</li> </ul>                              | <ul style="list-style-type: none"> <li>▪ Congestion fees</li> </ul>  |   |
| <b>Freight Movement Plan</b>             | <ul style="list-style-type: none"> <li>▪ High-volume freight deliveries &amp; truck movement to be restricted to night-time or off-peak hours</li> </ul>            | <ul style="list-style-type: none"> <li>▪ Freight logistics centers</li> </ul>  |   |
| <b>Technological Measures</b>            | <ul style="list-style-type: none"> <li>▪ Smart signalization</li> </ul>   | <ul style="list-style-type: none"> <li>▪ Integrated Command Control Centre</li> <li>▪ Adoption of CNG and electric for IPT vehicles and public transport buses respectively</li> </ul> |   |
| <b>Travel Demand Management Plan</b>     | <ul style="list-style-type: none"> <li>▪ Public education and awareness</li> </ul>  | <ul style="list-style-type: none"> <li>▪ Priced parking management</li> </ul>  |   |
| <b>Regulatory Measures</b>               | <ul style="list-style-type: none"> <li>▪ Robust traffic management and enforcement measures</li> </ul>  | <ul style="list-style-type: none"> <li>▪ Fare regulations</li> </ul>   |   |

| CMP Plans                  | List of Projects   |   |                    |
|----------------------------|--|---|--------------------|
|                            | Short-term Projects  | Medium-term projects  | Long-term projects |
|                            | <ul style="list-style-type: none"> <li>Data-sharing standards</li> </ul>   |   |                    |
| <b>Governance Measures</b> | <ul style="list-style-type: none"> <li>Build capacity for data driven decision making and integrate planning</li> </ul>  | <ul style="list-style-type: none"> <li>Operationalize BMLTA</li> </ul>  |                    |
| <b>Fiscal Measures</b>     | <ul style="list-style-type: none"> <li>New vehicle &amp; annual renewal for vehicle registration that is linked to pollution emission and fuel efficiency</li> </ul> | <ul style="list-style-type: none"> <li>Dynamic pricing to capture and charge vehicle usage</li> <li>Institute friendlier tax environment on inputs and revenues for public transport operators</li> </ul> |                    |

The CMP shall be implemented in phases. The phasing of projects has been carried out on the basis of the city needs and readiness of the city for implementing the proposed projects. The phases are defined as follows:

- Phase 1 indicates projects that would be taken up from 2020 to 2022
- Phase 2 indicates projects that would be taken up from 2023 to 2027
- Phase 3 indicates projects that would be taken up from 2028 to 2035

Accordingly, projects prioritized in phase 1, 2 and 3 proposals for Bangalore are shown in Table 5.2, Table 5.3 and Table 5.4

**Table 5-2: Phase 1 Projects and Cost**

| SN | Projects                             | Unit   | Quantity | Rates (Rs in crores) | Total Cost (Rs in crores) |
|----|--------------------------------------|--------|----------|----------------------|---------------------------|
| 1  | Metro Rail                           | Km     | 58       | 275                  | 15,950                    |
| 2  | Sub-urban Rail - Shared Track        | Km     | 28       | 10                   | 280                       |
| 3  | Sub-urban Rail - Dedicated Track     | Km     | 46       | 126                  | 5,781                     |
| 4  | Bus priority corridors               | Km     | 54       | 5                    | 270                       |
| 5  | Bus fleet (augmentation/replacement) | Nos    | 4,250    | 0.7                  | 3,000                     |
| 6  | Corridor improvements                | Km     | 50       | 30                   | 1,500                     |
| 7  | Junction improvements                | Nos    | 51       | 10                   | 510                       |
| 8  | Construction of FoBs                 | Nos    | 50       | 2                    | 100                       |
| 9  | Major Junction Capacity Augmentation | Nos    | 3        | 600                  | 1,800                     |
| 10 | Widening of Roads                    | Km     | 50       | 100                  | 5,000                     |
| 11 | Peripheral ring road (PRR)           | Km     | 20       | 154                  | 3,080                     |
| 12 | Multimodal mobility fare system      |        |          | 25                   | 25                        |

| <b>Total CMP Implementation Cost</b> | <b>2,30,366</b>   |

## 5.2 Funding of Projects

### 5.2.1 Funding Options

The mobility infrastructure being public good, the bulk of the investment funding has to come from fiscal resources. However, the same can be complemented by appropriate levies on commuters and residents in general based on their mobility choices and on economic transactions in Bengaluru having implications on the mobility.

With the measures proposed below, it should be possible to step-up the investment in mobility infrastructure and public transport from current level of about Rs. 8250 crore, i.e. 1.65 per cent of city's GDP to Rs. 20000 crore per annum, i.e., 4 per cent of city's GDP.

#### 5.2.1.1 Fiscal Resources

##### (a) Government of Karnataka

The current fiscal levies by the Government of Karnataka for mobilization of resources for urban infrastructure including mobility infrastructure throughout the state lead to annual mobilization of Rs.750 crores. These levies are 10 per cent cess plus 1 per cent additional cess on motor vehicle tax for transport infrastructure and state transport fund, and surcharge on stamp duty at the rate of 2 and 3 per cent for urban local bodies and rural local.

It is recommended that the tax base for these cess and surcharge should be expanded to cover state excise duty and the rates of these cess and surcharge should also be enhanced to mobilize additional Rs.2000 crore per annum over and above the current level of around Rs.750 crore in the following manner:

- Increasing the cess on motor vehicle tax from current 10 per cent to 20 per cent of the tax throughout the state.

- ii. Increasing surcharge on stamp duty and registration fee on land transactions in Bengaluru from current 2 per cent to 10per cent of the stamp duty and registration fee.
- iii. Levy of cess on sale of fuel for motor vehicles in Bengaluru City.

The levy of the above proposed cess should be should be decided from the perspective of overall fiscal policy of the government and likely impact of the cess on the economic activities.

## **(b) Government of India**

The current level of fiscal support from GoI for mobility infrastructure in Bengaluru by way of interest free funds and sovereign loans at concessional terms from multilateral and bilateral development agencies is of order of Rs.2000 crore per annum. It is recommended that the infrastructure agencies should step-up their planning and project management capacities so as to be able to seek and utilize at least double the current level of fiscal support from GoI.

Bengaluru is one of the cities selected under smart city mission by Government of India. Components such as Tender Sure Roads, Integrated Command Control Center, Smart Bus Shelters and promoting NMT are being planned.

It is recommended that the total support for mobility infrastructure and public transport systems from fiscal resources of GOI and GoK should be enhanced from current level of Rs.8250 crore per annum, subject to fiscal capacity.

### **5.2.1.2 Additional Resource Mobilization (ARM)**

#### **(a) Land Value Capture:**

The Transit Oriented Development (TOD) can contribute to sustainable mobility systems and can also be source of funding the required investment by way of Land Value Capture, i.e., collecting a part of the land value appreciation due to TOD led densification and increase in Floor Area Ratio (FAR) whenever there is a land transaction or development in the TOD impact zone. In addition, an appropriate infrastructure cess on approvals for newer layouts and building plans in the city in general is recommended as another means of land value capture. However, the rate of this cess should be much lower than the rate of cess or premium fee in the TOD impact zone as the land owners outside the impact zone will have indirect gains from the mobility infrastructure and public transport systems.

#### **(b) Parking Fee:**

High and graded parking fee, based on the location, reflecting the economic cost of parking infrastructure is recommended to fund the infrastructure as well as to fund infrastructure development for alternate and sustainable modes like pedestrian/cycling infrastructure,

public transport, and also to implement other travel demand management measures that could help reduce reliance on private vehicle usage.

### **(c) Congestion Fee**

Congestion fees on the use of private vehicles and IPT during specified peak hours on specified arterial and major roads with vehicle to capacity ratio of more than one is suggested as a means of financing the mobility infrastructure by capturing the cost of negative externality from such modes. The collection of the congestion fee should be entirely unobtrusive by using appropriate telemetry and camera-based detection technology (such as automatic number plate recognition technology) and prior mandate-based automatic collection from bank accounts linked to the vehicle registration.

BBMP should be responsible for levying the congestion fee, as it has the primary mandate of maintaining urban roads. Enforcement however, must be given to the Transport Department, as it has the database of registered vehicles and it is the government interface for vehicle owners for all matters vehicle-related. Amendments would need to be made to the Karnataka Municipal Corporation Act, 1976 and the Karnataka Motor Vehicle Taxation Act, 1957 to enable the levy and collection of congestion fees. The collected amount should come to the proposed Bangalore Infrastructure Fund and then allocated for improving road infrastructure. To enable effective collection of congestion fees, a governing mechanism must be developed to ensure coordination between the BBMP and the Transport Department. The proposed Bengaluru Metropolitan Land Transport Authority may facilitate the coordination between BBMP and Transport Department and establish the required IT system.

### **(d) Revenues from advertisement on public transport infrastructure**

The draft regulations by BBMP, namely Outdoor Signage and Public Messaging Byelaws 2018 for banning advertising at public places, should be reviewed as advertising provides a good revenue source and should be encouraged judiciously. Such advertising in eco-friendly manner without hampering the traffic safety is taken-up in all major cities and highways, and there does not appear any cogent reason to take a contrarian view for Bengaluru city. The revenues from such advertisements can be a significant source of funds for operations and maintenance of public transport.

### **(e) Public-Private Partnership with Corporate for metro station naming rights and direct access:**

The financing of public transport by private companies under PPP mode is found to be largely impractical due to allocation of risks related to traffic volume and fare determination. However, limited scope PPP for long- term naming rights for metro or other public transport stations and direct elevated access from corporates premises is recommended as a means for mobilizing resources.

**(f) TOD at metro stations and depots**

Full utilization of permissible FAR at metro stations and depots or assignment" of unutilized FAR as Transferrable Development Rights (TDR) are recommended to leverage the TOD potential for financing the PT infrastructure.

**(g) Roof-top solar power plants at metro stations and depots**

Such solar power plants are recommended for economizing the operating cost of metro.

**5.2.1.3 Levy of cess and surcharge under Section 18A of Karnataka Town and Country Planning (KTCP) Act, 1961**

As per KTCP Act, the Planning Authority may while granting permission for development of land or building levy and collect from the owner of such land or building: - (i) a cess for the purpose of carrying out any water supply scheme; (ii) a surcharge for the purpose of construction of PRR and widening of arterial roads; (iii) a cess for the purpose of improving slums; and (iv) a surcharge for the purpose of establishing Mass Rapid Transport System. At such rates but all the above levies together not exceeding one-tenth of the market value of the land or building as may be prescribed.

**5.2.1.4 Bengaluru Infrastructure Fund:**

It is recommended that a separate Bengaluru Infrastructure Fund (BIF) should be created in the public account of the state government. The fiscal resources mobilized by way of cess and select ARM's after collection in the consolidated fund should get transferred to the BIF through appropriation from the budget. The surcharge under section 18A of KTCP Act and other mobility related non-fiscal levies by local and planning bodies should be deposited in the BIF directly. The funds from the BIF should be distributed to the concerned mobility infrastructure and public transport agencies (BBMP, BDA, BMTC, BMRCL, B-RIDE) and other city infrastructure agencies (BWSSB and BESCOM) in the prescribed proportions for utilizing for projects approved by BMLTA in accordance with the city's Comprehensive Mobility Plan.

The extra budgetary resources, except proceeds from advertising, PPP, TOD at stations and roof-top solar plants which are specific to an agency, should also come to the common pool in the BIF and then distributed for the approved projects in the agreed proportions.

### 5.2.1.5 Public Private Partnership (PPP)

The Comprehensive Mobility Plan has projected huge investments which cannot alone come from the budgetary sources. There is need for fast tracking and investments in infrastructure. PPP is recognized as one of the possible options. There are different PPP modes ranging between low and high levels of participation and their involvement, can be utilized based on the suitability of project's needs. Infrastructure Development Department (IDD) is the nodal agency for identifying, developing and processing PPP projects. It will assist the agencies in development and funding and approval of components of Comprehensive Mobility Plan by the State Level Single Window Agency for Public Clearance Committee under the Chairmanship of Chief Minister. Furthermore, it has empaneled transaction advisors, who can assist the agencies in selection of PPP partners.

The four major "families" of PPP modes are:

#### Management contracts

This involves contracting to the private sector most or all of the operations and maintenance of a public facility or service. Although the ultimate obligation of service provision remains with the public authority, the day-to-day management control is vested with the private sector. Usually the private sector is not required to make capital investments. Maintenance of roads can be done under this model.

**Table 5.6: Characteristics of Management Contracts**

| Modes               | Asset ownership | Duration                     | Capital investment focus & responsibility                           | Private partner roles                                   | Potential Sectors   |
|---------------------|-----------------|------------------------------|---|---|---|
| Management Contract | Public          | Short – medium (e.g. 3-5yrs) | Not the focus<br>Public   | Management of all aspects of operation and maintenance. | <ul style="list-style-type: none"> <li>▪ Maintenance of roads</li> <li>▪ Bus Terminals</li> </ul> |
| Management Contract | Public          | Medium – long                | Limited Focus<br>Brownfield (Rehabilitation / expansion)<br>Private | Minimum Capex, Management, Maintenance                  |   |

**(a) Lease contracts**

Under this model, asset is leased, either by the public entity to the private partner or vice-versa.

**Table 5.7: Characteristics of Lease Contracts**

| Modes   | Asset ownership                    | Duration                | Capital investment focus & responsibility | Private partner roles      | Potential Sectors  |
|---|------------------------------------|-------------------------|---|----------------------------|--|
| Lease Contracts   | Public                             | Medium (e.g., 10-15yrs) | Not the focus<br>Public                   | Management and maintenance | <ul style="list-style-type: none"> <li>Leasing of retail outlets at metro rail stations</li> </ul> |
| Build Lease Transfer (BLT) or Build-Own-Lease-Transfer (BOLT) | Private (Leased to the government) | Medium (e.g. 10-15yrs)  | Greenfield<br>Private                     | Capex                      | <ul style="list-style-type: none"> <li>Development of bus terminal</li> </ul>                      |
| Build-Transfer-Lease (BTL)                                    | Public                             | Medium (e.g., 10-15yrs) | Greenfield<br>Private                     | Capex and Operations       |  |

**(b) Concessions**

This model involves the responsibility for construction (typically brownfield / expansions) and operations with the private partner while ownership is retained by the public sector.

**Table 5.8: Characteristics of Concessions**

| Modes            | Asset ownership | Duration              | Capital investment focus & responsibility | Private partner roles                        | Potential Sectors |
|------------------|-----------------|-----------------------|---|--|-------------------|
| Area Concessions | Public          | Long (e.g. 20-30 yrs) | Brownfield/<br>Expansions<br>Private      | Design, finance, construct, manage, maintain | Ring roads        |

**(c) Build-operate-transfer (BOT) and its variants**

Under Build-Operate-Transfer (**BOT**) Contracts, the responsibility for construction (typically Greenfield) and operations with the private partner while ownership is retained by the public sector.

**Table 5.9: Characteristics of BOT Contracts**

| Modes  | Asset ownership | Duration                    | Capital investment focus & responsibility | Private partner roles                        | Potential Sectors  |
|--|-----------------|-----------------------------|---|--|--|
| Design-build-operate (DBO)   | Public          | Short-medium (e.g. 3-5 yrs) | Greenfield<br>Public                      | Design, construct, manage, maintain          | Elevated corridors, monorail, etc.   |
| Build-operate-transfer (BOT)/<br>Design-Build-Finance-Operate-Transfer (DBFOT) | Public          | Long (e.g. 20-30 yrs)       | Greenfield<br>Private                     | Design, finance, construct, manage, maintain | <ul style="list-style-type: none"> <li>▪ ISBT</li> <li>▪ Metro</li> <li>▪ Parking infrastructure</li> <li>▪ Bus terminal</li> <li>▪ Bus station,</li> <li>▪ Truckterminals,</li> <li>▪ Bus queue shelters (BQS)</li> </ul> |
| Build-operate-transfer (BOT) Annuity   | Public          | Long (e.g. 20-30 yrs)       | Greenfield<br>Private                     | Design, finance, construct, manage, maintain | <ul style="list-style-type: none"> <li>▪ Bus terminal</li> </ul>   |

Under **Build-own-operate Transfer (BOOT) Contracts**, private partner has the responsibility for construction and operations. Ownership is with the private partner for the duration of the concession.

**Table 5.10: Characteristics of BOOT Contracts**

| Modes | Asset ownership | Duration | Capital investment focus & responsibility | Private partner roles | Potential Sectors |
|-------|-----------------|----------|---|-----------------------|-------------------|
|-------|-----------------|----------|---|-----------------------|-------------------|

|  |         |                       |                    |  |  |
|--|---------|-----------------------|--------------------|--|--|
| Build-own-operate-transfer (BOOT) or DBOOT | Private | Long (e.g. 20-30 yrs) | Greenfield Private | Design, construct, own, manage, maintain, transfer | <ul style="list-style-type: none"> <li>▪ Parking infrastructure</li> <li>▪ BRTS</li> <li>▪ Logistic hub</li> <li>▪ Bus queue shelters (BQS)</li> </ul> |
| Build-own-operate (BOO)                    | Private | Perpetual             | Greenfield Private | Design, finance, construct, own, manage, maintain  |  |

For PPP projects, which are not commercially viable, Government of India has notified VGF scheme for financial support to infrastructure projects to an extent of upto 20% of the total project cost. In addition, the GoK has introduced Karnataka Viability Gap Funding (KVGF) to extend financial support to private partners upto an additional 20% of the total project cost. IDD also provide fund for conducting feasibility studies of projects taken up under PPP.

### 5.2.1.6 Transferable Development Rights (TDR)

TDR shall be applicable as per provisions Section 14-B of KTCP Act and the Rules notified by the Government Karnataka from time to time. The FAR against TDR shall be subject to the FAR allowable against FAR for respective land uses subject to fulfillment of other regulations. TDR scheme should be the primary mode for funding for the lands required for widening the roads. An electronic platform for trading of TDR should be established.

### 5.2.2 Funding Options for Urban Transport Projects

The project-wise potential funding options are given in Table 5.11

**Table 5-11: Potential Funding Options**

| Plan/Projects                                | Potential Funding Options |               |                       |     |                      |
|--|---------------------------|---------------|-----------------------|-----|----------------------|
|  | State Govt.               | Central Govt. | Multilateral Agencies | PPP | Innovative Financing |
| <b>Integrated Land Use and Mobility Plan</b> |                           |               |                       |     |                      |
| · Transit Oriented Development               |                           |               |                       |     |                      |
| <b>Public Transport Improvement Plan</b>     |                           |               |                       |     |                      |
| · Bus fleet augmentation                     |                           |               |                       |     |                      |
| · Bus priority corridors                     |                           |               |                       |     |                      |
| · Suburban Rail on existing tracks           |                           |               |                       |     |                      |

| Plan/Projects  | Potential Funding Options |               |                       |     |                      |
|--|---------------------------|---------------|-----------------------|-----|----------------------|
|  | State Govt.               | Central Govt. | Multilateral Agencies | PPP | Innovative Financing |
| · BRTS/Metrolite   |                           |               |                       |     |                      |
| · Bus depots/terminals                                   |                           |               |                       |     |                      |
| · Metro Rail   |                           |               |                       |     |                      |
| · Dedicated Suburban Rail                                |                           |               |                       |     |                      |
| <b>Road Network Development Plan</b>                     |                           |               |                       |     |                      |
| · Junction improvements                                  |                           |               |                       |     |                      |
| · Foot over bridges/ walkways                            |                           |               |                       |     |                      |
| · Capacity Augmentation of Major Junctions               |                           |               |                       |     |                      |
| · Corridor improvements                                  |                           |               |                       |     |                      |
| · Parking infrastructure                                 |                           |               |                       |     |                      |
| · Peripheral ring road                                   |                           |               |                       |     |                      |
| · Road widening  |                           |               |                       |     |                      |
| · Elevated corridors                                     |                           |               |                       |     |                      |
| <b>Non-Motorized Transport Plan</b>                      |                           |               |                       |     |                      |
| · Public bicycle sharing                                 |                           |               |                       |     |                      |
| · Footpath development                                   |                           |               |                       |     |                      |
| · Cycle track development                                |                           |               |                       |     |                      |
| · Pedestrian only streets                                |                           |               |                       |     |                      |
| <b>Multi-Modal Mobility Plan</b>                         |                           |               |                       |     |                      |
| · Elevated walkways connecting public transport stations |                           |               |                       |     |                      |
| · Intermodal transit hubs                                |                           |               |                       |     |                      |
| · Multi-modal mobility fare system                       |                           |               |                       |     |                      |
| <b>Private Transport Management Plan</b>                 |                           |               |                       |     |                      |
| · Insurance premium based on usage                       |                           |               |                       |     |                      |
| · Proof of parking for vehicle ownership                 |                           |               |                       |     |                      |
| · Congestion fees  |                           |               |                       |     |                      |

| Plan/Projects  | Potential Funding Options |               |                       |     |                      |
|--|---------------------------|---------------|-----------------------|-----|----------------------|
|  | State Govt.               | Central Govt. | Multilateral Agencies | PPP | Innovative Financing |
| <b>Freight Movement Plan</b>   |                           |               |                       |     |                      |
| · High-volume freight deliveries & truck movement to be restricted to night-time or off-peak hours               |                           |               |                       |     |                      |
| · Freight logistics centers  |                           |               |                       |     |                      |
| <b>Technological Measures</b>  |                           |               |                       |     |                      |
| · Smart signalization  |                           |               |                       |     |                      |
| · Integrated Command Control Centre  |                           |               |                       |     |                      |
| · Adoption of CNG and electric for IPT vehicles and public transport buses respectively                          |                           |               |                       |     |                      |
| <b>Travel Demand Management Plan</b>   |                           |               |                       |     |                      |
| · Public education and awareness   |                           |               |                       |     |                      |
| · Priced parking management  |                           |               |                       |     |                      |
| <b>Regulatory Measures</b>   |                           |               |                       |     |                      |
| · Robust traffic management and enforcement measures   |                           |               |                       |     |                      |
| · Data-sharing standards   |                           |               |                       |     |                      |
| · Fare regulations   |                           |               |                       |     |                      |
| <b>Governance Measures</b>   |                           |               |                       |     |                      |
| · Build capacity for data driven decision making and integrate planning  |                           |               |                       |     |                      |
| · Operationalize BMLTA   |                           |               |                       |     |                      |
| <b>Fiscal Measures</b>   |                           |               |                       |     |                      |
| · New vehicle & annual renewal for vehicle registration that is linked to pollution emission and fuel efficiency |                           |               |                       |     |                      |
| · Dynamic pricing to capture and charge vehicle usage  |                           |               |                       |     |                      |
| · Institute friendlier tax environment on inputs and revenues for public transport operators                     |                           |               |                       |     |                      |

### 5.3 Monitoring of CMP

CMP should be the basis for approving projects, plans and various regulatory measures within the city related to transport to ensure that the development is integrated and supplement each other to achieve the desired outcomes. It is therefore important to monitor and measure the impact of interventions taken as an outcome of CMP. There will be two levels of monitoring:

- The first level of monitoring can be with regard to the status of implementation of the Comprehensive Mobility Plan in terms of time frames proposed and achieved. This is helpful to understand the pace of CMP implementation.
- The second level of monitoring can be to understand the impact of CMP implementation. The indicators created as a part of CMP can form the basis of this monitoring which can be done on a biannual basis.

An efficient monitoring system for the implementation of development in an integrated manner would be required for the success of the any implementation plan. It is therefore important to have one unified authority, which can stitch all the various agencies involved in the development of city, and ensure the overall objectives and development goals are met.

At present, following is the list of departments and organizations involved in urban affairs and urban transport in Bangalore.

- Urban Development Department (UDD), Government of Karnataka
- Transport Department, Government of Karnataka
- Directorate of Urban Land Transport (DULT)
- Bangalore Development Authority (BDA)
- Bruhat Bengaluru MahanagaraPalike (BBMP)
- Bangalore Metro Rail Corporation Ltd. (BMRCL)
- Rail Infrastructure Development Company (Karnataka) Limited (K-RIDE)
- Bangalore Metropolitan Transport Corporation (BMTCL)
- Karnataka State Road Transport Corporation (KSRTC)
- Traffic Police, Bangalore
- Karnataka Road Development Corporation (KRDCCL)
- Public Works Department, Government of Karnataka
- National Highway Authority of India (NHAI)
- State Pollution Control Board, Bangalore

The Agencies responsible for the implementation of Plans / projects have been detailed in the matrices below.

**Table 5-12: Action Plan – Lead Agency**

| Action Plan                           | UDD | Transport Department | DULT / BMLTA | BDA | BBMP | BMRCL | K-RIDE, Railway | BMTC | KSRTC | Traffic Police | KRDCL |

| Action Plan                   | UDD | Transport Department | DULT / BMLTA | BDA | BBMP | BMRCL | K-RIDE, Railway | BMTC | KSRTC | Traffic Police | KRDCL |
|-------------------------------|-----|----------------------|--------------|-----|------|-------|-----------------|------|-------|----------------|-------|
| Travel Demand Management Plan | ✓   | ✓                    | ✓            |     |      |       |                 |      |       |                |       |
| Regulatory Measures           | ✓   | ✓                    | ✓            |     | ✓    |       |                 |      |       | ✓              |       |
| Governance Measures           | ✓   |                      | ✓            |     |      |       |                 |      |       |                |       |
| Fiscal Measures               | ✓   | ✓                    | ✓            | ✓   |      |       |                 |      |       |                |       |

## Institutional Framework

With a view to coordinate all urban transport activities in the city, it is recommended that the existing Bengaluru Metropolitan Land Transport Authority (BMLTA), set up in 2007 through an executive order, should be given the legislative anchoring for its effective functioning as the planning, coordination and decision making body for all matters related to urban transport in the city. The authority should be the Unified Metropolitan Transport Authority (UMTA) for regulation of the development, operations, maintenance, monitoring, supervision and provision of urban transport within Bengaluru mobility area.

BMLTA should have the following overall responsibilities:

### 1. Regulatory / Policy

- Setting norms/ Standards / Guidelines / Policies
- Transport Service levels
- TSM Guidelines

### 2. Planning

- Land use – transport integration
- Comprehensive Mobility Plans Preparation / Upgradation and Implementation
- Procurement / Contracting
- Inter-modal coordination

### 3. Funding

- Project approval through TIP (Transport Investment Plan)
- State/Central fund sanctioning and channeling

### 4. Co-Ordination

- Co-Ordination with other Urban Infrastructure departments

### 5. Management

- Direct development and management of high density mobility corridors and other projects, as may be assigned by the government.

A draft bill for constituting the UMTA for Bengaluru i.e. BMLTA has been prepared and is being finalised to provide statutory status to BMLTA. The authority should be constituted under the Chairmanship of Chief Minister and heads of the departmental stakeholders, subject experts and representatives from civil society should be members. To discharge the technical and administrative functions of the authority, an Executive Committee should be constituted comprising of the following members:

(i) Additional Chief Secretary to Government, Urban Development Department - Executive President

(ii) Principal Secretary, Transport Department - Member

- (iii) ACS/Principal Secretary to Government, Finance Department - Member
- (iv) Commissioner, Bruhat Bangalore Mahanagara Palike (BBMP) - Member
- (v) Commissioner, Bangalore Development Authority (BDA) - Member
- (vi) Commissioner, Bangalore Metropolitan Region Development Authority - Member
- (vii) Managing Director, Bangalore Metro Rail Corporation Limited - Member
- (viii) Managing Director, Bangalore Metropolitan Transport Corporation – Member
- (ix) Managing Director, Rail Infrastructure Development Company (Karnataka) Limited – Member
- (ix) Director of Town and Country Planning - Member
- (x) Additional Commissioner of Police (Traffic) - Member
- (xi) CEO of the Authority - Member Secretary

The Commissioner of Directorate of Urban Land Transport, Government of Karnataka should be the Chief Executive Officer of the Authority and Directorate of Urban Land Transport (DULT) should act as the secretariat for the Authority.

#### **5.4 Stakeholder's Consultation**

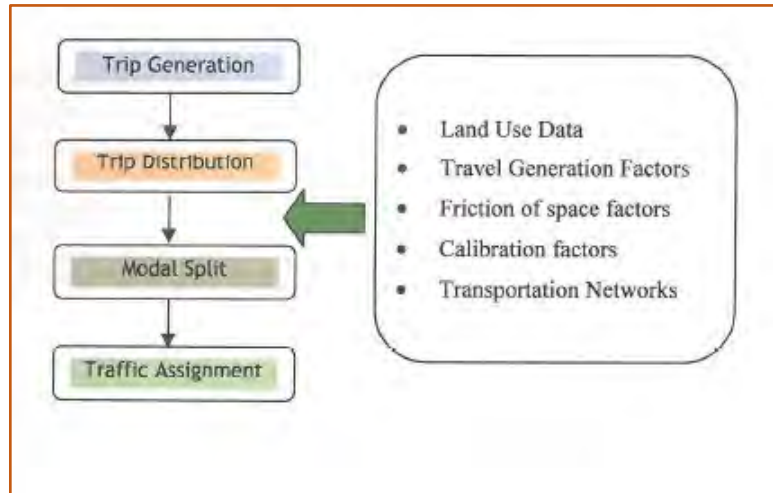

The draft CMP was hosted on DULT and BMRCL Website from 06.12.2019 to 20.01.2020 for public comments and suggestions. Almost 3500 comments / suggestions were received. Focus group meetings were also held with citizen and expert groups. All relevant comments / suggestions have been considered and incorporated in final CMP appropriately.

The CMP provides a good road map to plan and implement various projects and activities for improving share of public transport, regulating demand for private transport, and providing efficient and sustainable mobility options for the commuters.

## ANNEXURE 3.1 Transport Demand Model

### 3.1. Development of Transport Model

An urban transport model to replicate the “Bengaluru Metro Politian Area” transportation system (roads, Congestion delays, transit system, etc.) has been developed with a state-of-the-art software and modeling technology. This model can be used for forecasting, using altered model inputs to reflect future year conditions. By simulating roadway conditions and travel demand on those roadways, deficiencies in the system can be assessed. Potential major future network enhancements such as introduction of an MRTS or land use modifications can be analyzed by this too land its efficacy can be established at a planning level.

Several software programs are available for developing travel demand models. The Bangalore transport model has been developed using CUBE (a state-of-the-art Travel Demand Modeling software).

#### Model Structure

The model is based on a conventional 4-stage transport model approach. It includes:

**Trip Generation** — calculating the number of origins and destinations for each zone.

**Trip Distribution** — attaching the origins and destinations for complete trips

**Mode Choice**— determining the mode for each trip, car, Intermediate Public Transport (IPS, Public transport).

**Assignment** — assigning passengers to their respective highway and transit networks.

#### Model Input

- Road network inventory
- Public Transportation Details
- Planning variables by zones
- Trip End Information

## Network Development

Transport network developed for the model comprises of two components,

- Highway Network for vehicles
- Transit Network for public transport system i.e. Buses and any new public transportation system.

- **Modes:** The modes that are modeled under the study includes Two wheeler, Private Cars, Intermediate Public Transport, Public Transport i.e. Bus. The non- motorized transport and commercial were considered as a preload
- **Zoning:** 519 zones within BMRDA Region, and 15 external zones
- **Network:** The highway (road) network considered all the Key arterials, sub arterials and collectors. The transit system considered with the existing public transport system in all its forms, i.e. bus with their routes, frequency, fare structure etc.
- **Planning Period:** Year 2016 is considered as the base year and 2031 has been set as the horizon year for the planning of the long term strategy

Each of the networks is described in detail below

### Highway Network

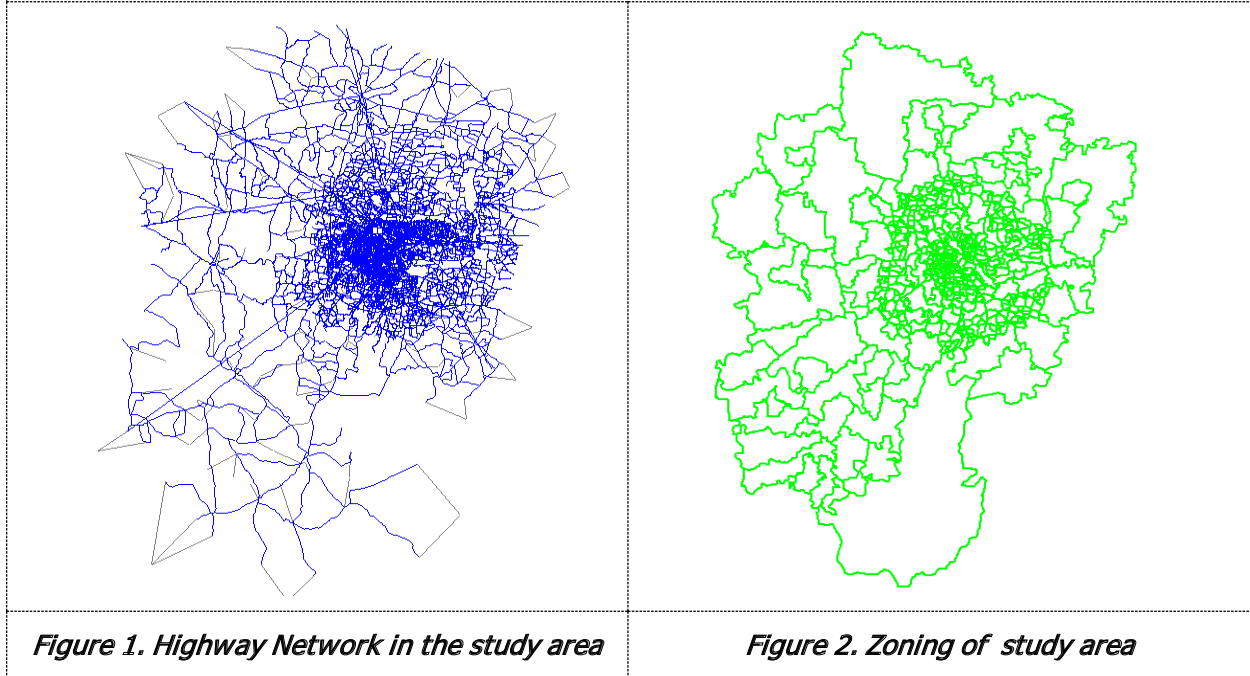

The coded highway network for the study area represents the nodes (intersections) and links between them. Connectivity between the network and zones is provided through centroid connectors. Each link has been assigned attributes such as: number of lanes; divided or undivided carriageway; encroachments; availability of footpaths etc. The highway network and zoning are shown in **Fig 1** and **Fig 2** respectively.

### Transit Network

The transit network represents the connectivity, headways, speeds and accessibility of transit services. In Bangalore, local buses, auto rickshaws and taxies ply on the main corridors. So, City bus transport system, Bangalore Phase- I Metro Corridors, auto rickshaws and intercity bus routes are included in the model's transit network. The transit routes are specified as those using the transport links and having stops/stations at determined locations. The access to the stops/stations from zone centroids and other nodes is provided either by existing highway links or by defining exclusive walk links. The distance between the bus stop/stations is assumed between 500m to 1000m in the public transport assignment. Figure presents the transit network for the study area.

Currently, about 2500 city bus routes are operated in the Bangalore urban area. Information on the

same was collected and coded in to the system. Fare structure and frequency for each of these services are also included. The transit network in the study area is shown in **Fig 3**.

*Figure 3. Transit Network in the study area*

### Development of Matrices

Bangalore CTTS-2008 parameters and Population and Employment data of base year 2015 were used to develop the synthesized matrices. Observed mode wise trip matrices were developed based on synthesized matrices and roadside passenger interview data. External trips for the car, two wheelers, IPT, public transport and commercial vehicles were constructed based on the O- D survey conducted at the outer cordon. **Table 1** presents the observed mode wise trips.

The mode wise matrices were developed for morning peak hour. From the primary surveys it has been observed that the morning peak is during 09:00 AM to 10:00 AM. So the model was built for this duration. Stages of Transport Model Building as shown below in **Fig 4, Fig 5, and Fig 6**.

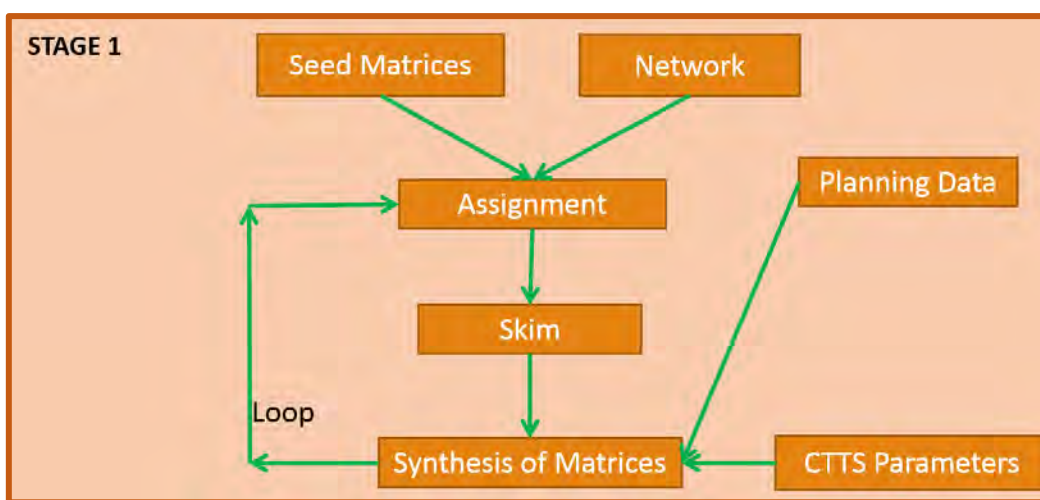

Figure 4. Stage 1

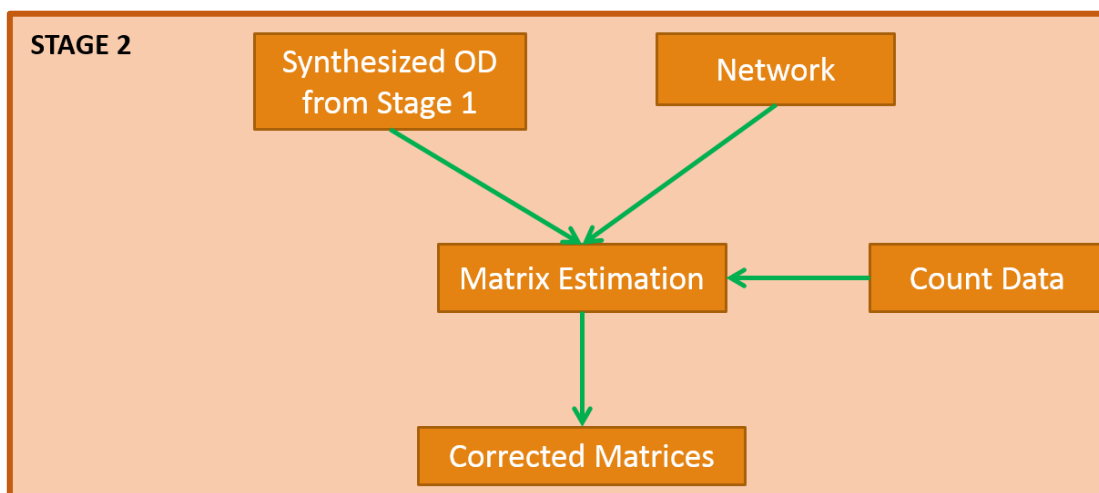

Figure 5. Stage 2

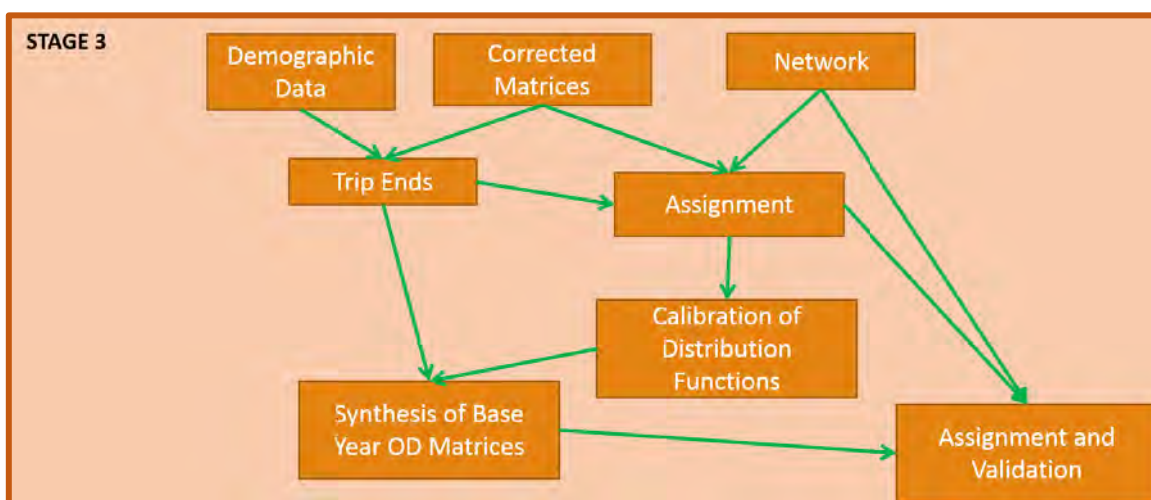

Figure 6.Stage 3

Table 1. Observed mode wise Trips (Peak Hour)

| Sl. No | Mode                      | Internal trips   | External trips | Total Trips      | Percentage  |
|--------|---------------------------|------------------|----------------|------------------|-------------|
| 1      | Car Passengers            | 2,46,607         | 5,657          | 2,52,263         | 21%         |
| 2      | Two-wheeler Passengers    | 2,89,290         | 3,798          | 2,93,088         | 24%         |
| 3      | IPT Passengers            | 74,713           | 551            | 75,264           | 6%          |
| 4      | Public Transit Passengers | 5,71,271         | 6,810          | 5,78,080         | 48%         |
|        | <b>Total</b>              | <b>11,81,881</b> | <b>16,816</b>  | <b>11,98,695</b> | <b>100%</b> |

### Highway Assignment

A user equilibrium multi model Assignment procedure based on generalized cost was used for loading matrices in PCU Values.

### Transit Assignment

The public transport assignment process is a multi-path assignment which enumerates and evaluate the “reasonable” or “attractive” multiple discrete routes between zones, considering number of transfers and vehicle in cost, boarding and transfer penalties and fares etc.

### Validation

The observed highway and public transport matrices were assigned on the network and the assigned traffic volume screen lines and at cordons. The model is validated across cordons and screen lines within a confidence range of +/-15%. Validation results are given in **Table 2,3 and 4**.

**Table 2. Base Years Observed OD Validation on NSW Screen line**

| NSW         | East Bound(EB) |          |              | West Bound(WB) |          |              |
|-------------|----------------|----------|--------------|----------------|----------|--------------|
|             | Observed       | Assigned | % Difference | Observed       | Assigned | % Difference |
| Car         | 10887          | 10205    | 6.3%         | 6030           | 5822     | 3.4%         |
| Two Wheeler | 12930          | 11920    | 7.8%         | 8649           | 8574     | 0.9%         |
| IPT         | 3447           | 3641     | 5.6%         | 2266           | 2037     | 10.1%        |

**Table 3. Base Years Observed OD Validation on EW Screen line**

| EW          | North Bound(NB) |          |              | South Bound(SB) |          |              |
|-------------|-----------------|----------|--------------|-----------------|----------|--------------|
|             | Observed        | Assigned | % Difference | Observed        | Assigned | % Difference |
| Car         | 10261           | 10740    | 4.7%         | 10631           | 12179    | 14.6%        |

| IPT         | 3817            | 4030     | 5.6%         | 2890            | 2812     | 2.7%         |

**Table 4. Base Years Observed OD Validation on NSE Screen line**

| NSE         | East Bound(EB) |          |              | West Bound(WB) |          |              |
|-------------|----------------|----------|--------------|----------------|----------|--------------|
|             | Observed       | Assigned | % Difference | Observed       | Assigned | % Difference |
| Car         | 8576           | 7991     | 3.4%         | 7267           | 6987     | 3.9%         |
| Two Wheeler | 7452           | 8519     | 14.3%        | 7595           | 8591     | 13.1%        |
| IPT         | 978            | 972      | 0.6%         | 976            | 952      | 2.4%         |

**Calibration**

Trip Generation: Trip end models were calibrated by relating the trip produced from and attracted to the zones with the Land use. The base year population and employment for the study area is presented in the **Table 5.**

**Table 5. Base Years Population and Employment**

| Sub Area     | Population | Employment |
|--------------|------------|------------|
| <b>BBMP</b>  | 10,211,863 | 4,864,447  |
| <b>BMA</b>   | 821,570    | 632,404    |
| <b>BMR</b>   | 2,808,875  | 1,481,874  |
| <b>TOTAL</b> | 13,842,307 | 6,978,725  |

The calibrated trip end models for peak hour are presented in **Table 6** below for Bengaluru.

**Table 6. Generation and Attraction Model**

| Sub Area    | GENERATION MODEL             | ATTRACTION MODEL           |
|-------------|------------------------------|----------------------------|
| <b>BBMP</b> | 0.0977 * Population + 1587.6 | 0.166* Employment+ 2368.2  |
| <b>BMA</b>  | 0.089 * Population + 0.34    | 0.1364* Employment+ 33.12  |
| <b>BMR</b>  | 0.0189 * Population + 4.34   | 0.0331* Employment+ 56.541 |

**Combined Mode choice cum Distribution Model**

The trip distribution and model split phase carried out jointly using a combined mode choice cum doubly constrained gravity model of the form:

$$T_{ijm} = r_i G_i S_j A_j F_{ijm}$$

Where T= number of inter zonal trips by mode m

G= Total generation trip ends by zone

A= Total attraction trip ends by zone

i= Generation Zone

j= Attraction Zone

r,s = Balancing factors (constants)

F<sub>ij</sub>= deterrence function for mode m

$$F_{ij} = K_m e^{\beta C_{ijm}} C_{ijm}^{\alpha}$$

Where K= Constant Factor

C=Generalized Cost

β= Calibration Constant -Exponential function

$\alpha$ =Calibration Constant- Power function

Double Constraints are imposed by ensuring that

$$\sum_{jm} Tij = Gi \text{ And } \sum_{im} Tij = Ai$$

The Calibrated parameters are given in **Table 7**.

**Table 7. Deterrence Functions**

| <b>Mbde</b>             | <b>K</b> | <b><math>\alpha</math></b> | <b><math>\beta</math></b> |
|-------------------------|----------|----------------------------|---------------------------|
| <b>Car</b>              | 0.45     | -0.04                      | 0.012                     |
| <b>Two-Wheeler</b>      | 0.1      | 0.42                       | 0.03                      |
| <b>IPT</b>              | 0.5      | -0.29                      | 0.01                      |
| <b>Public Transport</b> | 4        | -0.24                      | 0.031                     |

The form of the model is such that exponential ( $\alpha=0$ ) or power ( $\beta=0$ ) functions may be used for the deterrence function. The inclusion of both  $\alpha$  and  $\beta$  represents a gamma function, sometimes called a Tanner function

## ANNEXURE 3.2

### Population Projections

#### Population Projections<sup>1</sup>

RMP-2031 has carried out projections for the spatially constant Bengaluru Metropolitan Area based on the past trends by deploying different statistical models and component method. The models and method included are:

1. Linear Model (this assumes that Population would increase steadily in a linear pattern); Quadratic Model and Cubic Models (this assumes that population would experience fluctuations in growth pattern)
2. Logistic Model (this assumes that population would reach saturation at some point in the future).
3. Ration Method (this assumes that population would increase steadily in relation to Karnataka Urban Population)
4. Component Method (using birth and death rate and migration)

Population projections for BMA based on different methods (Statistical and Demographic) ranges from 11.8 million to 24.7 million for 2031. Table 6-7 clearly shows that Linear Method and Component (demographic) method are predicting two extreme ends of the projections. Linear method has projected the lowest population for 2031. However, these estimates are likely to attain by the year 2017 in reality. Hence, these estimates can't be considered. The component method has projected population for higher end, which is almost 2.5 times the 2011 population for BMA. Hence, considering this population may be inappropriate.

**Table 6-7: Observed & Projected Population Range for BMA: 1971-2031 (in '00000)**

| Year                        | Observed Population | Projected Population |               |                |                |           |              |
|-----------------------------|---------------------|----------------------|---------------|----------------|----------------|-----------|--------------|
|                             |                     | Linear               | Quadratic     | Cubic          | Logistic       | Component | Ratio Method |
| 1971                        | 20.12               | 16.06                | 21.22         | 20.06          | 21.24          | NA        | NA           |
| 1981                        | 32.58               | 33.08                | 30.5          | 32.83          | 30.6           | NA        | NA           |
| 1991                        | 45.3                | 50.09                | 44.93         | 44.93          | 44.09          | NA        | NA           |
| 2001                        | 61.9                | 67.11                | 64.53         | 62.2           | 63.51          | NA        | NA           |
| 2011                        | 90.45               | 84.13                | 89.29         | 90.45          | 91.49          | 98        | 90.45        |
| 2016                        |                     | 92.64                | 103.6         | 110.52         | 109.81         | 116.26    | 108.2        |
| 2021                        |                     | 101.15               | 119.21        | 135.51         | 131.8          | 149.14    | 129.44       |
| 2026                        |                     | 109.65               | 136.1         | 166.17         | 158.19         | 192.2     | 157.93       |
| 2031                        |                     | 118.16               | 154.29        | 203.21         | 189.87         | 247.38    | 192.68       |
| <b>R-square<sup>2</sup></b> |                     | <b>0.96436</b>       | <b>0.9954</b> | <b>0.99991</b> | <b>0.99376</b> | <b>NA</b> | <b>NA</b>    |

<sup>1</sup> Like any other forecasts, population forecasts have their limitations. Master Plan has attempted to project the population for the BMA by as scientific an approach as possible with available data. Predicting the future course of human fertility, mortality and migration is an educated guess at best, especially when these are bound to be deeply influenced by advancements in medicine, food production and availability, climatic variability, socio-cultural setting, political and economic conditions and a host of other factors. Therefore, caution must be exercised while making or using population projections. The main limitation of this population projection exercise is that the projections have been made on the basis of a

limited five decades of data considering the unavailability of earlier Census records due to change in jurisdiction. Another limitation is limited data availability for age, sex, mortality & birth and in-migration at planning area level, which is essential input to the demographic method of population projection.

$R^2 = \text{Explained variation} / \text{Total variation}$ ;  $R^2$  is always between 0 and 1. a) 0 indicates that the model explains none of the variability of the response data around its mean and b) 1 indicates that the model explains all the variability of the response data around its mean. In general, the higher the  $R^2$ , the better the model fits your data. However, there are important conditions for this guideline that I'll talk about both in this post and my next post.

Population projections by three methods, namely Logistics, Ratio and Cubic method are in the range of 19-20 million. The projection by logistic model (19 million) is ideal considering the fact that the population cannot grow forever due to its natural carrying capacity limit and instead population growth will taper off and reach saturation. However, while planning for metropolitan region it would be appropriate to plan for higher range to account for sudden growth in the population – which cannot be predicted. Also, that the  $R^2$  among the statics method is close to accuracy for cubic method.

The Population Projection methodology and results were shared with Department of Economics and Statistics, GoK and Institute for Social and Economic Change for independent review and confirmation. Both have confirmed that the BMA population could be in the range of 19 to 20 million by 2031. Hence it is appropriate to consider projections by Cubic method at 20.3 million for BMA by 2031.

## ANNEXURE 4.1

### Draft Bengaluru Transit Oriented Development (TOD) Policy, January, 2019

#### 1 Introduction

- 1.1 Bengaluru is the capital of Karnataka state and fifth largest city in India in terms of population. The city is the foremost IT hub of the country and has a GDP<sup>1</sup> of \$110 billion which is 4<sup>th</sup> largest after Mumbai, Delhi and Kolkata. The Bengaluru Metropolitan Region (BMR)<sup>2</sup> is spread over an area about 1294 sq.km houses 9.1 million people as per 2011 census and is expected to double and reach about 20.3 million by 2031. Bruhat Bengaluru Mahanagara Palike (BBMP) which is the core of Metropolitan area houses 8.4 million people over an area of 712.54 sq.km. The population density of BMR and BBMP is 70 pph and 118 pph respectively which can be considered as medium density and lower than the URDPFI guidelines for Megacities.
- 1.2 Due to inadequate public transport (current share is about 48%), private vehicles have been growing exponentially. The city has second highest number of registered vehicles in India i.e. 75.06 lakh after New Delhi. Rapid growth of private vehicles coupled with inadequate road network has resulted in lower travel speeds, longer commuting time, traffic congestion, road fatalities, vehicular pollution which in turn led to economic costs and had an adverse impact on the quality of life. In order to address the above issues, transit oriented development (TOD) is the way forward. In this direction, Government of Karnataka has ambitious plans of expanding Metro and suburban rail services in the city with huge investments. TOD will help mass transit to achieve its full potential and aid in sustainable mobility.
- 1.3 It has been observed that there are anomalies in the approach of revised Master Plan -2031 which advocates TOD but fails to propose the landuse strategies. Bengaluru city needs to align its landuse and transport policies as per National Urban Transport Policy (2014), National TOD Policy (2017), Metro Policy (2017) and guide the developments along the mass transit corridors to achieve the sustainable mobility. Thus, TOD Policy will serve as guiding document to all agencies who are involved in planning and implementation of urban/transport projects.

#### 2 TOD Zones

- 2.1 Transit Oriented Development (TOD) is defined as the development of concentrated nodes of moderate-to-high mixed landuse density within 5 to 10 minutes of walking distance from mass transit

<sup>1</sup> Business World, June, 2017

<sup>2</sup> Area under BDA for which Revised Master Plan-2031 (draft) has been prepared.

stations which are well integrated with pedestrian, bicycle, feeder and transit networks. Broadly, TOD zone can be divided into three sub-zones for the purpose of application of TOD norms where transit stations are located are about on kilometre interval.

- a. Intense TOD Zone (500 m on either side of the transit corridor)
- b. Standard TOD Zone (500 m to 1000 m on either side of the transit corridor)
- c. Transition TOD Zone (1000 m to 2000 m on either side of the transit corridor)

2.1.1 However, for Commuter Rail where the interstation distance varies from 1.5 km to 3 km, Intense and Standard TOD zone shall be 500 m and 1000 m radius from the Rail Stations.

### 3 Scope and Applicability

3.1 The policy is applicable for all the Local bodies, Departments, Agencies, Authorities, Parastatals and Companies that play a role in the planning, funding, implementation, management and monitoring of urban transport and landuse operating in Bengaluru Metropolitan Region (BMR).

### 4 Vision

4.1 Bengaluru will be a public transport oriented city that is compact, people friendly, environment friendly and support economic growth while offering a good quality of life.

### 5 Goals

5.1 The major goals of TOD policy include achievement of 70% share of public transport in motorised trips and 60% of the city population living within intense TOD zone. This may require about 600 km<sup>3</sup> of mass transit corridors<sup>4</sup>. Adequate infrastructure shall be developed so as to achieve the gross density ranging from 250 to 400 pph<sup>5</sup> along the mass transit corridors by 2031.

### 6 Components of TOD and Policy Guidelines for TOD

6.1 The major components of TOD framework (also known as 6Ds) are density, diversity, design, destination accessibility, distance to transit and demand management.

---

<sup>3</sup> It is based benchmark of 0.03 km Mass transit per 1000 population.

<sup>4</sup> Metro Rail/Commuter Rail/ BRTS designed for a minimum Peak Hour Peak Direction Traffic (PHPDT) of 10,000 or more is considered as Mass Transit

<sup>5</sup> pph- persons per hectare

## 6.2 Density

- 6.2.1 TOD encourages higher population and employment densities along the mass transit corridors. The gross density of up to 2 times of the city population density shall be allowed in TOD Zone depending upon location, availability of infrastructure, landuse zoning and transit capacity. The gross density of 250 pph to 400 pph shall be achieved in TOD corridor by 2031 and accordingly, FSI in Intense TOD Zone and Standard TOD Zone shall be atleast 50% and 25% more than that of base FSI. Further, higher FSI more than the above shall be allowed in Intense TOD Zone subject to preparation and approval of Zonal Plan of the station influence area.
- 6.2.2 The additional FSI permissible over the base FSI shall be treated as premium FSI and shall be charged as a percentage of Guideline value. The revenue shall be deposited in TOD fund for augmentation of infrastructure in TOD Zone.
- 6.2.3 The minimum plot size for availing the higher FSI based on the above in TOD zone shall be 1000 sq.m and the minimum road width shall be 18 m. For other plot sizes and road widths, minimum of 20% higher than the existing FSI shall be allowed.
- 6.2.4 Encourage amalgamation and reconstitution of plots for utilization of higher FSI with incentives such as no charges for approval of plans etc. Relaxation in setbacks and coverage shall be allowed wherever appropriate.
- 6.2.5 Higher FSI shall be allowed for transit stations i.e. Metro, Commuter Rail etc., to allow composite development (station cum commercial development). Similarly, Bus Depots/Terminals and other Multi-modal hubs falling into TOD zone shall be given higher FSI. To optimise the space, multi-level bus parking shall be allowed.
- 6.2.6 Land banking shall be discouraged by levying vacant land tax<sup>6</sup> on underutilized land and/or underutilized FSI. This will ensure that all vacant and public lands are developed.

## 6.3 Diversity

- 6.3.1 TOD zone shall be designated as mixed use zone. Transit stations shall be classified based on typologies and mix of landuse that optimises level of density shall be encouraged. The landuse such as mixed landuse, affordable housing, employment nodes and recreational facilities/malls shall be encouraged to support TOD. The landuse such as low density housing, free parking and

---

<sup>6</sup> Currently Vacant Land tax is in force in Mumbai, Chennai and Visakhapatnam. In case of plots where built-up area is less than 25%, then remaining land can be considered as vacant land and tax can be imposed.

surface/multi-level parking, petrol pumps/CNG stations, automobile garages, warehouses and cremation grounds that does not support TOD shall be discouraged.

6.3.2 The policies encouraging redevelopment shall be incorporated through development control regulations. Separate Redevelopment Cell shall be established within BBMP/BDA to focus on redevelopment projects. Land pooling shall be adopted for redevelopment /revitalisation of inner city.

6.3.3 Mixed landuse integrated development shall be promoted for large parcels of land (with combination of housing for various income strata, commercial development, road and other infrastructure). In such developments, minimum 30% shall be allocated for residential, 20% for commercial, public & semi-public use and remaining 50% as per existing zoning. The minimum plot size shall be 5000 sq.m and minimum road width shall be 18 m. An additional 25% FSI over and above permissible FSI in Intense and standard TOD zone shall be allowed. Charges for premium FSI shall be exempted for affordable housing projects. No charges for amalgamation of plots should be levied.

6.3.4 The mixed use development has to mandatorily incorporate affordable housing and open spaces/circulation areas. In order to promote affordable housing, out of the 30% of residential use, a minimum of 20% of the built up area shall be utilized for EWS (30-40 sqm) and LIG (40-60 sqm) housing. Further, if according to the Zonal Development Plan, the land-use to be developed is residential, out of the 50% of the remaining built up area, a minimum of 30% shall be reserved for EWS and LIG housing. Existing slums in TOD zones shall be upgraded or encouraged for in-situ rehabilitation. As an incentive for slum redevelopment, a TDR of 30 sqm per slum household shall be provided. Rental housing and offices, hostels shall be encouraged along the TOD zones.

6.3.5 Open spaces<sup>7</sup> is critical to offset the impact of dense mixed use developments and improve environment and quality of life. Regulations may be framed to mandate the developer to allocate 10% of the land abutting the road for development of parks which are accessible to general public for the plot sizes more than 2500 sq.m<sup>8</sup>.

## 6.4 Design

6.4.1 Good built environment will encourage walking and cycling and promote the use of public transport. As per NMSH<sup>9</sup> parameters, streets shall be planned.

<sup>7</sup> Parks, play grounds, areas under landscaping and avenue tree plantations

<sup>8</sup> Chennai DCRs has such provisions. It is known as Open Space Reserve (OSR) land.

<sup>9</sup> Parameters for the National Mission on Sustainable Habitant (NMSH)- Report of the Sub-Committee on Urban Transport

- 6.4.2 Green buildings shall be encouraged by incentives such as additional FSI of 10% , reduced processing fee and priority clearance from development authorities.
- 6.4.3 Proven and innovative sustainable building, energy, water, landscape and waste management practices shall be implemented.
- 6.4.4 Bangalore Metropolitan Land Transport Authority (BMLTA), shall prepare and adopt street design guidelines and policy for pedestrians, NMT and parking to cater to the local context and ensure uniform implementation. This will help ready reference for various agencies involved planning, design and construction of various infrastructure elements within the city.

## **6.5 Destination Accessibility**

- 6.5.1 In order to improve the destination accessibility, roads along the mass transit corridors and other public transport corridors shall have minimum ROW of 30 m and 25 m respectively. At least one road on each side of the station which acts as feeder road shall have a minimum ROW of 15m.
- 6.5.2 High frequency feeder services in terms of regular buses, mini buses, mini vans shall be provided by transit agencies depending upon the commuter demand.
- 6.5.3 Park and Ride facilities shall be developed within station area for all the transit stations. Larger park and ride facilities shall be developed at terminal stations as well as stations at outskirts where availability of land is not a major constraint. Concessional parking rates for bicycle parking shall be adopted to promote the use of bicycles as an access mode to transit. Integrated network of Public Bike Sharing Scheme (PBS) shall be implemented.

## **6.6 Distance to Transit**

- 6.6.1 Direct walking paths to be provided to transit stations without any detour e.g. walking paths through parks, exclusive skywalks from major trip generators such as malls.

## **6.7 Demand Management**

- 6.7.1 Demand management includes parking management, congestion pricing, hawker management, flexi office timings, shift-wise schools and measures to encourage work at home to reduce the travel.
- 6.7.2 There is a need to increase the supply of paid off-street parking facilities at strategic locations to contain the tendency of on-street parking. Shared parking shall be developed at depots, terminals and multi-modal hubs etc. Registration of new cars shall be allowed subject to proof of having the parking facility at residence or shared parking facility of the community. In TOD zone parking of 1.33

ECS<sup>10</sup> per 100 Sqm. of development shall only be permitted. Shared and unbundled parking should be encouraged.

6.7.3 Regulation of hawkers is important to reduce the encroachments which obstruct the free flow of pedestrian and vehicular traffic through demarcation of hawker zones into red zone where hawkers are not permitted at all times, amber zone where hawkers are permitted during certain period of time and green zone where hawkers are permitted all the time. The civic body can issue to the licences with small fees to regulate the number of hawkers.

## 6.8 Augmentation of Infrastructure

6.8.1 Adequate provision of infrastructure is pre-requisite for transit oriented development. BMLTA in association with ULBs and other infrastructure agencies shall prepare a comprehensive plan integrating all the utilities, physical infrastructure and essential facilities such as roads, sewers, drainage, electric lines, green spaces, police post, fire post, electric sub-stations etc.

## 7 Institutional Framework

7.1 TOD is a complex urban development project involving multiple agencies and who carryout functions such as policy making, financing, development and management of various infrastructure facilities. The major agencies such as BDA, BBMP, BMTC, BMRCL, BWSSB, BESCOM, Traffic Police and RTO shall be involved in TOD project. In addition to above, PWD, NHAI and BIAL may also be required in some cases.

7.2 BMLTA was created in 2007 through GO, has limited powers to facilitate co-ordination, planning and implementation of urban transport programs and could not play the role of UMTA as envisaged. Therefore, BMLTA needs to be revived with adequate powers, funding and technical and managerial staff to discharge the functions of UMTA.

7.3 BMLTA shall review the funding of TOD projects and take steps for mobilization of funds and encouraging Public Private Participation (PPP) projects. It shall laydown principles of sharing the revenue collected from various sources and ensure that revenue is actually disbursed to all the agencies involved in TOD.

7.4 There is a need for capacity building in all the organizations in the area of urban planning, transport planning, economics, financing and PPP, real estate etc., to handle TOD projects. Financing, PPP and

---

<sup>10</sup> ECS (Equivalent Car Space) of Car, 2-Wheeler, Cycle, Bus and Commercial vehicle is **1.0, 0.25, 0.1, 3.5** and **3.5** respectively.

real estate market dynamics are critical for success of TOD projects and therefore BMLTA shall build capacity in these areas.

## 8 Financing of TOD Projects

- 8.1 The various sources for land value capture include charges for premium FSI, Development charges, one time betterment levy, transfer of development right (TDR), Cess on stamp duty and registration charges etc., Other potential sources of revenue include enhanced property taxes in TOD influence zone, Vacant land tax to discourage land banking etc., The revenue sources available for transit companies include property development, lease from commercial space, advertisement, station branding, multipurpose smart cards for ticketing etc.
- 8.2 Air rights of transit station areas are not utilized much in India over the Metro stations. This need to be explored though various funding and development models with private sector.
- 8.3 Transit companies can also raise capital by floating tax free Bonds and loans from multi-lateral agencies like World Bank, ADB, JICA and EIB etc., Separate TOD fund shall be created for infrastructure up-gradation/maintenance, enhancement of viability of transit systems etc. in TOD Zone.

## 9 Implementation Strategy

- 9.1 BMLTA shall undertake planning, design, funding and oversee implementation of TOD projects. Actual implementation shall be carried out by respective infrastructure agencies such as BBMP, BMRCL, BMTC, BWSSB etc.
- 9.2 TOD Policies shall be incorporated in the Master Plan. Development Control regulations which are part of Master Plan shall be revised in line with philosophy of TOD. A separate chapter shall be incorporated on TOD in Master Plan describing overall objective, demarcation of TOD zones, Landuse and Transport strategy, provisions and incentives for promotion of TOD.
- 9.3 GIS mapping of developments shall be utilized to identify the violations of building regulations. This will bring in transparency and make available of rich source of useful information for monitoring real estate trends, forecast of revenue from value capture methods and helps in planning future strategies. Steep penalty shall be imposed for violations. In case where building violations have severe negative impact on the surroundings, buildings shall be demolished. Adequate staff shall be deployed for monitoring the building violations.

- 9.4 Funding is critical for implementation of TOD project. The broad resource plan shall be prepared clearly identifying various sources of revenues, rules for sharing of costs, benefits and risks among the stakeholders. This will ensure long term commitment of public agencies and private sector for implementation of TOD projects.

### **10 Communication and outreach**

- 10.1 Communication and outreach programmes shall be primarily be carried by BMLTA in addition to local bodies and infrastructure agencies. Implementation of TOD projects can only be successful if the concepts of TOD and benefits are communicated to broader audience i.e. various stakeholders involved in landuse and transport planning, private developers and general public through workshops, consultations and market outreach programs through print, electronic and social media.
- 10.2 Atleast 0.5% of the annual budget of TOD shall be earmarked for communication and outreach programs.

**ANNEXURE 4.2**

### DESIGN AND MONITORING FRAMEWORK – CHECKLIST

The design and monitoring framework is a results-based tool for conceptualizing, designing, implementing, monitoring and evaluating projects. It provides structure to the project planning process and helps to communicate essential information about the project to stakeholders in an efficient, easy-to-read format.

| Design Summary   | Guidance  |
|--|---|
| <p><b>Outcome</b></p> <p>The outcome that follows from having successfully produced outputs. The outcome should be directly attributable to the scheme/project (subject to assumptions and risks) and be achievable by completion of the scheme/project.</p> | <ul style="list-style-type: none"> <li><input type="checkbox"/> Is the outcome given as a single succinct statement of a desired development result? There should be only one outcome statement.</li> <li><input type="checkbox"/> Is the outcome phrased as a development result and not as an activity or as a restatement of outputs?</li> <li><input type="checkbox"/> Is the outcome plausible for having delivered the outputs (subject to assumptions and risks)?</li> <li><input type="checkbox"/> Is achievement of the outcome solely attributable to the project?</li> <li><input type="checkbox"/> Can the outcome plausibly be attained by the end of the scheme/project (subject to assumptions and risks)?</li> <li><input type="checkbox"/> Does the outcome statement reflect an expected improvement from a baseline situation?</li> <li><input type="checkbox"/> Is it clear from the outcome statement what is the problem or opportunity being addressed?</li> </ul> |

| Design Summary  | Guidance  |
|---|---|
| <p><b>Outputs</b></p> <p>The physical goods, services, institutional and/or behavioral changes produced by the project.</p>   | <ul style="list-style-type: none"> <li>❑ Should be phrased as the main “deliverables” that arise from using inputs and transforming these through activities.</li> <li>❑ There should be no words in the output description that imply action—these are activities.</li> <li>❑ Can the outputs plausibly be produced carrying out the planned activities and with the inputs to be provided (taking account of assumptions and risks)?</li> <li>❑ Components are not outputs although outputs can be grouped under component sub-headings.</li> </ul> |
| <p><b>Activities</b></p> <p>Groups of tasks carried out to transform inputs into each output to be produced. Only the main activities should be included—in particular, those whose completion represent important milestone dates that will allow implementation progress to be tracked.</p> | <ul style="list-style-type: none"> <li>❑ Have the main activities, necessary to produce the outputs, been included?</li> <li>❑ Are activities grouped (numbered) by output so that the relationship between activities and outputs is clear?</li> <li>❑ Do activities describe a transformation process rather than simply rephrasing outputs as activities?</li> <li>❑ Can the activities plausibly be carried out with the proposed inputs?</li> <li>❑ Are all important milestone events reflected as activities?</li> </ul>                       |
| <p><b>Inputs</b></p> <p>The main resources (financial and in-kind) required to carry out the project provided by government, private partner, co-financiers, NGOs, beneficiaries and other stakeholders.</p>  | <ul style="list-style-type: none"> <li>❑ Is funding by key cost category (civil works, equipment, consulting services, etc.) spelt out?</li> <li>❑ Are complementary inputs by the, Government of India, private sector, beneficiaries, NGOs, etc., stated in financial or physical terms?</li> </ul>   |

### Indicators/Performance Targets

**Indicators** are the measures to be used for determining the level of achievement of a result area (impact, outcome, outputs), and milestones indicate the completion of activities. Indicators can be quantitative (i.e., no. of G2C or B2C transaction increased by...) or qualitative (satisfaction level of citizens increased by ....). Qualitative indicators are more meaningful and better suited to measure benefits.

A **target** is the timebound and desired level of achievement for a results area (impact, outcome, outputs), over a baseline level.

| Checklist  | Guidance  |
|--|---|
| <input type="checkbox"/> Outcome and outputs have at least one measurable indicator with an explicit target. There is no point in having a planned result area outcome, output if its attainment will not or cannot be measured or assessed. | <input type="checkbox"/> Indicators and targets should be <b>SMART</b> (specific, measurable, attributable, relevant and time bound). |

### Data Sources/Reporting Mechanisms

Data sources (who) are those that provide the information for measuring the attainment for each target/indicator.

Reporting mechanisms (how) indicate in which form the information is provided.

| Checklist   | Guidance |
|---|----------|
| Established sources, either within or outside the Government should be preferred. |          |
| Data sources should be very specific.   |          |
| Each indicator has at least one source of data.                                   |          |
